                          ForwardIterator first, Size n, Generator gen);
```

```

template<input_or_output_iterator O, sentinel_for<O> S, copy_constructible F>
    requires invocable<F&& && indirectly_writable<O, invoke_result_t<F&&>>
    constexpr O ranges::generate(O first, S last, F gen);
template<class R, copy_constructible F>
    requires invocable<F&& && output_range<R, invoke_result_t<F&&>>
    constexpr borrowed_iterator_t<R> ranges::generate(R&& r, F gen);
template<input_or_output_iterator O, copy_constructible F>
    requires invocable<F&& && indirectly_writable<O, invoke_result_t<F&&>>
    constexpr O ranges::generate_n(O first, iter_difference_t<O> n, F gen);

```

Let  $N$  be  $\max(0, n)$  for the `generate_n` algorithms, and  $\text{last} - \text{first}$  for the `generate` algorithms.

*Mandates:* Size is convertible to an integral type (7.3.9, 11.4.8).

*Effects:* Assigns the result of successive evaluations of `gen()` through each iterator in the range  $[\text{first}, \text{first} + N)$ .

*Returns:*  $\text{first} + N$ .

*Complexity:* Exactly  $N$  evaluations of `gen()` and assignments.

## 27.7.8 Remove

[alg.remove]

```

template<class ForwardIterator, class T>
    constexpr ForwardIterator remove(ForwardIterator first, ForwardIterator last,
                                     const T& value);
template<class ExecutionPolicy, class ForwardIterator, class T>
    ForwardIterator remove(ExecutionPolicy&& exec,
                          ForwardIterator first, ForwardIterator last,
                          const T& value);

template<class ForwardIterator, class Predicate>
    constexpr ForwardIterator remove_if(ForwardIterator first, ForwardIterator last,
                                       Predicate pred);
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
    ForwardIterator remove_if(ExecutionPolicy&& exec,
                             ForwardIterator first, ForwardIterator last,
                             Predicate pred);

template<permutable I, sentinel_for<I> S, class T, class Proj = identity>
    requires indirect_binary_predicate<ranges::equal_to, projected<I, Proj>, const T*>
    constexpr subrange<I> ranges::remove(I first, S last, const T& value, Proj proj = {});
template<forward_range R, class T, class Proj = identity>
    requires permutable<iterator_t<R>> &&
    indirect_binary_predicate<ranges::equal_to, projected<iterator_t<R>, Proj>, const T*>
    constexpr borrowed_subrange_t<R>
        ranges::remove(R&& r, const T& value, Proj proj = {});
template<permutable I, sentinel_for<I> S, class Proj = identity,
        indirect_unary_predicate<projected<I, Proj>> Pred>
    constexpr subrange<I> ranges::remove_if(I first, S last, Pred pred, Proj proj = {});
template<forward_range R, class Proj = identity,
        indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
    requires permutable<iterator_t<R>>
    constexpr borrowed_subrange_t<R>
        ranges::remove_if(R&& r, Pred pred, Proj proj = {});

```

Let  $E$  be

- `bool(*i == value)` for `remove`;
- `bool(pred(*i))` for `remove_if`;
- `bool(invoker(proj, *i) == value)` for `ranges::remove`;
- `bool(invoker(pred, invoker(proj, *i)))` for `ranges::remove_if`.

*Preconditions:* For the algorithms in namespace `std`, the type of `*first` meets the *Cpp17MoveAssignable* requirements (Table 33).

*Effects:* Eliminates all the elements referred to by iterator *i* in the range  $[first, last)$  for which *E* holds.

*Returns:* Let *j* be the end of the resulting range. Returns:

- *j* for the overloads in namespace `std`.
- $\{j, last\}$  for the overloads in namespace `ranges`.

*Complexity:* Exactly `last - first` applications of the corresponding predicate and any projection.

*Remarks:* Stable (16.4.6.8).

NOTE 1 Each element in the range  $[ret, last)$ , where *ret* is the returned value, has a valid but unspecified state, because the algorithms can eliminate elements by moving from elements that were originally in that range.

```
template<class InputIterator, class OutputIterator, class T>
constexpr OutputIterator
    remove_copy(InputIterator first, InputIterator last,
                OutputIterator result, const T& value);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
        class T>
ForwardIterator2
    remove_copy(ExecutionPolicy&& exec,
                ForwardIterator1 first, ForwardIterator1 last,
                ForwardIterator2 result, const T& value);

template<class InputIterator, class OutputIterator, class Predicate>
constexpr OutputIterator
    remove_copy_if(InputIterator first, InputIterator last,
                   OutputIterator result, Predicate pred);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
        class Predicate>
ForwardIterator2
    remove_copy_if(ExecutionPolicy&& exec,
                   ForwardIterator1 first, ForwardIterator1 last,
                   ForwardIterator2 result, Predicate pred);

template<input_iterator I, sentinel_for<I> S, weakly_incrementable O, class T,
        class Proj = identity>
requires indirectly_copyable<I, O> &&
    indirect_binary_predicate<ranges::equal_to, projected<I, Proj>, const T*>
constexpr ranges::remove_copy_result<I, O>
    ranges::remove_copy(I first, S last, O result, const T& value, Proj proj = {});
template<input_range R, weakly_incrementable O, class T, class Proj = identity>
requires indirectly_copyable<iterator_t<R>, O> &&
    indirect_binary_predicate<ranges::equal_to, projected<iterator_t<R>, Proj>, const T*>
constexpr ranges::remove_copy_result<borrowed_iterator_t<R>, O>
    ranges::remove_copy(R&& r, O result, const T& value, Proj proj = {});
template<input_iterator I, sentinel_for<I> S, weakly_incrementable O,
        class Proj = identity, indirect_unary_predicate<projected<I, Proj>> Pred>
requires indirectly_copyable<I, O>
constexpr ranges::remove_copy_if_result<I, O>
    ranges::remove_copy_if(I first, S last, O result, Pred pred, Proj proj = {});
template<input_range R, weakly_incrementable O, class Proj = identity,
        indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
requires indirectly_copyable<iterator_t<R>, O>
constexpr ranges::remove_copy_if_result<borrowed_iterator_t<R>, O>
    ranges::remove_copy_if(R&& r, O result, Pred pred, Proj proj = {});
```

Let *E* be

- `bool(*i == value)` for `remove_copy`;
- `bool(pred(*i))` for `remove_copy_if`;
- `bool(invoker(proj, *i) == value)` for `ranges::remove_copy`;
- `bool(invoker(pred, invoker(proj, *i)))` for `ranges::remove_copy_if`.

Let  $N$  be the number of elements in  $[\text{first}, \text{last})$  for which  $E$  is false.

*Mandates:*  $\text{*first}$  is writable (25.3.1) to result.

*Preconditions:* The ranges  $[\text{first}, \text{last})$  and  $[\text{result}, \text{result} + (\text{last} - \text{first}))$  do not overlap.

NOTE 2 For the overloads with an `ExecutionPolicy`, a performance cost is possible if `iterator_traits<ForwardIterator1>::value_type` does not meet the *Cpp17MoveConstructible* (Table 31) requirements.

*Effects:* Copies all the elements referred to by the iterator  $i$  in the range  $[\text{first}, \text{last})$  for which  $E$  is false.

*Returns:*

- $\text{result} + N$ , for the algorithms in namespace `std`.
- $\{\text{last}, \text{result} + N\}$ , for the algorithms in namespace `ranges`.

*Complexity:* Exactly  $\text{last} - \text{first}$  applications of the corresponding predicate and any projection.

*Remarks:* Stable (16.4.6.8).

## 27.7.9 Unique

[alg.unique]

```
template<class ForwardIterator>
constexpr ForwardIterator unique(ForwardIterator first, ForwardIterator last);
template<class ExecutionPolicy, class ForwardIterator>
ForwardIterator unique(ExecutionPolicy&& exec,
                      ForwardIterator first, ForwardIterator last);

template<class ForwardIterator, class BinaryPredicate>
constexpr ForwardIterator unique(ForwardIterator first, ForwardIterator last,
                                BinaryPredicate pred);
template<class ExecutionPolicy, class ForwardIterator, class BinaryPredicate>
ForwardIterator unique(ExecutionPolicy&& exec,
                      ForwardIterator first, ForwardIterator last,
                      BinaryPredicate pred);

template<permutable I, sentinel_for<I> S, class Proj = identity,
        indirect_equivalence_relation<projected<I, Proj>> C = ranges::equal_to>
constexpr subrange<I> ranges::unique(I first, S last, C comp = {}, Proj proj = {});
template<forward_range R, class Proj = identity,
        indirect_equivalence_relation<projected<iterator_t<R>, Proj>> C = ranges::equal_to>
requires permutable<iterator_t<R>>
constexpr borrowed_subrange_t<R>
ranges::unique(R&& r, C comp = {}, Proj proj = {});
```

Let `pred` be `equal_to{}` for the overloads with no parameter `pred`, and let  $E$  be

- `bool(pred(*(i - 1), *i))` for the overloads in namespace `std`;
- `bool(invoke(comp, invoke(proj, *(i - 1)), invoke(proj, *i)))` for the overloads in namespace `ranges`.

*Preconditions:* For the overloads in namespace `std`, `pred` is an equivalence relation and the type of  $\text{*first}$  meets the *Cpp17MoveAssignable* requirements (Table 33).

*Effects:* For a nonempty range, eliminates all but the first element from every consecutive group of equivalent elements referred to by the iterator  $i$  in the range  $[\text{first} + 1, \text{last})$  for which  $E$  is true.

*Returns:* Let  $j$  be the end of the resulting range. Returns:

- $j$  for the overloads in namespace `std`.
- $\{j, \text{last}\}$  for the overloads in namespace `ranges`.

*Complexity:* For nonempty ranges, exactly  $(\text{last} - \text{first}) - 1$  applications of the corresponding predicate and no more than twice as many applications of any projection.

```
template<class InputIterator, class OutputIterator>
constexpr OutputIterator
unique_copy(InputIterator first, InputIterator last,
           OutputIterator result);
```

```

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
ForwardIterator2
    unique_copy(ExecutionPolicy&& exec,
                ForwardIterator1 first, ForwardIterator1 last,
                ForwardIterator2 result);

template<class InputIterator, class OutputIterator,
         class BinaryPredicate>
constexpr OutputIterator
    unique_copy(InputIterator first, InputIterator last,
                OutputIterator result, BinaryPredicate pred);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class BinaryPredicate>
ForwardIterator2
    unique_copy(ExecutionPolicy&& exec,
                ForwardIterator1 first, ForwardIterator1 last,
                ForwardIterator2 result, BinaryPredicate pred);

template<input_iterator I, sentinel_for<I> S, weakly_incremtable O, class Proj = identity,
         indirect_equivalence_relation<projected<I, Proj>> C = ranges::equal_to>
requires indirectly_copyable<I, O> &&
    (forward_iterator<I> ||
     (input_iterator<O> && same_as<iter_value_t<I>, iter_value_t<O>>) ||
     indirectly_copyable_storable<I, O>)
constexpr ranges::unique_copy_result<I, O>
    ranges::unique_copy(I first, S last, O result, C comp = {}, Proj proj = {});
template<input_range R, weakly_incremtable O, class Proj = identity,
         indirect_equivalence_relation<projected<iterator_t<R>, Proj>> C = ranges::equal_to>
requires indirectly_copyable<iterator_t<R>, O> &&
    (forward_iterator<iterator_t<R>> ||
     (input_iterator<O> && same_as<range_value_t<R>, iter_value_t<O>>) ||
     indirectly_copyable_storable<iterator_t<R>, O>)
constexpr ranges::unique_copy_result<borrowed_iterator_t<R>, O>
    ranges::unique_copy(R&& r, O result, C comp = {}, Proj proj = {});

```

Let `pred` be `equal_to{}` for the overloads in namespace `std` with no parameter `pred`, and let  $E$  be

- `bool(pred(*i, *(i - 1)))` for the overloads in namespace `std`;
- `bool(invoker(comp, invoker(proj, *i), invoker(proj, *(i - 1))))` for the overloads in namespace `ranges`.

*Mandates:* `*first` is writable (25.3.1) to `result`.

*Preconditions:*

- The ranges `[first, last)` and `[result, result+(last-first))` do not overlap.
- For the overloads in namespace `std`:
  - The comparison function is an equivalence relation.

For the overloads with no `ExecutionPolicy`, let  $T$  be the value type of `InputIterator`. If `InputIterator` models `forward_iterator` (25.3.4.11), then there are no additional requirements for  $T$ . Otherwise, if `OutputIterator` meets the *Cpp17ForwardIterator* requirements and its value type is the same as  $T$ , then  $T$  meets the *Cpp17CopyAssignable* (Table 34) requirements. Otherwise,  $T$  meets both the *Cpp17CopyConstructible* (Table 32) and *Cpp17CopyAssignable* requirements.

NOTE For the overloads with an `ExecutionPolicy`, a performance cost is possible if the value type of `ForwardIterator1` does not meet both the *Cpp17CopyConstructible* and *Cpp17CopyAssignable* requirements.

*Effects:* Copies only the first element from every consecutive group of equal elements referred to by the iterator  $i$  in the range `[first, last)` for which  $E$  holds.

*Returns:*

- `result + N` for the overloads in namespace `std`.

— {last, result + N} for the overloads in namespace ranges.

*Complexity:* Exactly last - first - 1 applications of the corresponding predicate and no more than twice as many applications of any projection.

### 27.7.10 Reverse

[alg.reverse]

```
template<class BidirectionalIterator>
constexpr void reverse(BidirectionalIterator first, BidirectionalIterator last);
template<class ExecutionPolicy, class BidirectionalIterator>
void reverse(ExecutionPolicy&& exec,
             BidirectionalIterator first, BidirectionalIterator last);
```

```
template<bidirectional_iterator I, sentinel_for<I> S>
requires permutable<I>
constexpr I ranges::reverse(I first, S last);
template<bidirectional_range R>
requires permutable<iterator_t<R>>
constexpr borrowed_iterator_t<R> ranges::reverse(R&& r);
```

*Preconditions:* For the overloads in namespace std, BidirectionalIterator meets the Cpp17ValueSwappable requirements (16.4.4.3).

*Effects:* For each non-negative integer  $i < (\text{last} - \text{first}) / 2$ , applies std::iter\_swap, or ranges::iter\_swap for the overloads in namespace ranges, to all pairs of iterators first + i, (last - i) - 1.

*Returns:* last for the overloads in namespace ranges.

*Complexity:* Exactly (last - first)/2 swaps.

```
template<class BidirectionalIterator, class OutputIterator>
constexpr OutputIterator
reverse_copy(BidirectionalIterator first, BidirectionalIterator last,
            OutputIterator result);
template<class ExecutionPolicy, class BidirectionalIterator, class ForwardIterator>
ForwardIterator
reverse_copy(ExecutionPolicy&& exec,
             BidirectionalIterator first, BidirectionalIterator last,
             ForwardIterator result);
```

```
template<bidirectional_iterator I, sentinel_for<I> S, weakly_incremtable O>
requires indirectly_copyable<I, O>
constexpr ranges::reverse_copy_result<I, O>
ranges::reverse_copy(I first, S last, O result);
template<bidirectional_range R, weakly_incremtable O>
requires indirectly_copyable<iterator_t<R>, O>
constexpr ranges::reverse_copy_result<borrowed_iterator_t<R>, O>
ranges::reverse_copy(R&& r, O result);
```

Let  $N$  be last - first.

*Preconditions:* The ranges [first, last) and [result, result + N) do not overlap.

*Effects:* Copies the range [first, last) to the range [result, result + N) such that for every non-negative integer  $i < N$  the following assignment takes place:  $*(\text{result} + N - 1 - i) = *(\text{first} + i)$ .

*Returns:*

— result + N for the overloads in namespace std.

— {last, result + N} for the overloads in namespace ranges.

*Complexity:* Exactly  $N$  assignments.

## 27.7.11 Rotate

[alg.rotate]

```
template<class ForwardIterator>
constexpr ForwardIterator
rotate(ForwardIterator first, ForwardIterator middle, ForwardIterator last);
template<class ExecutionPolicy, class ForwardIterator>
ForwardIterator
rotate(ExecutionPolicy&& exec,
       ForwardIterator first, ForwardIterator middle, ForwardIterator last);
```

```
template<permutable I, sentinel_for<I> S>
constexpr subrange<I> ranges::rotate(I first, I middle, S last);
```

*Preconditions:* [first,middle) and [middle,last) are valid ranges. For the overloads in namespace std, ForwardIterator meets the *Cpp17ValueSwappable* requirements (16.4.4.3), and the type of \*first meets the *Cpp17MoveConstructible* (Table 31) and *Cpp17MoveAssignable* (Table 33) requirements.

*Effects:* For each non-negative integer  $i < (\text{last} - \text{first})$ , places the element from the position  $\text{first} + i$  into position  $\text{first} + (i + (\text{last} - \text{middle})) \% (\text{last} - \text{first})$ .

NOTE This is a left rotate.

*Returns:*

- $\text{first} + (\text{last} - \text{middle})$  for the overloads in namespace std.
- {first + (last - middle), last} for the overload in namespace ranges.

*Complexity:* At most last - first swaps.

```
template<forward_range R>
requires permutable<iterator_t<R>>
constexpr borrowed_subrange_t<R> ranges::rotate(R&& r, iterator_t<R> middle);
```

*Effects:* Equivalent to: return ranges::rotate(ranges::begin(r), middle, ranges::end(r));

```
template<class ForwardIterator, class OutputIterator>
constexpr OutputIterator
rotate_copy(ForwardIterator first, ForwardIterator middle, ForwardIterator last,
            OutputIterator result);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
ForwardIterator2
rotate_copy(ExecutionPolicy&& exec,
            ForwardIterator1 first, ForwardIterator1 middle, ForwardIterator1 last,
            ForwardIterator2 result);
```

```
template<forward_iterator I, sentinel_for<I> S, weakly_incrementable O>
requires indirectly_copyable<I, O>
constexpr ranges::rotate_copy_result<I, O>
ranges::rotate_copy(I first, I middle, S last, O result);
```

Let  $N$  be last - first.

*Preconditions:* [first,middle) and [middle,last) are valid ranges. The ranges [first,last) and [result,result +  $N$ ) do not overlap.

*Effects:* Copies the range [first,last) to the range [result,result +  $N$ ) such that for each non-negative integer  $i < N$  the following assignment takes place:  $\text{*(result} + i) = \text{*(first} + (i + (\text{middle} - \text{first})) \% N)$ .

*Returns:*

- result +  $N$  for the overloads in namespace std.
- {last, result +  $N$ } for the overload in namespace ranges.

*Complexity:* Exactly  $N$  assignments.

```
template<forward_range R, weakly_incrementable O>
requires indirectly_copyable<iterator_t<R>, O>
constexpr ranges::rotate_copy_result<borrowed_iterator_t<R>, O>
```

```
ranges::rotate_copy(R&& r, iterator_t<R> middle, 0 result);
```

*Effects:* Equivalent to:

```
return ranges::rotate_copy(ranges::begin(r), middle, ranges::end(r), std::move(result));
```

### 27.7.12 Sample

[alg.random.sample]

```
template<class PopulationIterator, class SampleIterator,
        class Distance, class UniformRandomBitGenerator>
SampleIterator sample(PopulationIterator first, PopulationIterator last,
                    SampleIterator out, Distance n,
                    UniformRandomBitGenerator&& g);

template<input_iterator I, sentinel_for<I> S, weakly_increamentable O, class Gen>
requires (forward_iterator<I> || random_access_iterator<O>) &&
    indirectly_copyable<I, O> &&
    uniform_random_bit_generator<remove_reference_t<Gen>>
O ranges::sample(I first, S last, O out, iter_difference_t<I> n, Gen&& g);
template<input_range R, weakly_increamentable O, class Gen>
requires (forward_range<R> || random_access_iterator<O>) &&
    indirectly_copyable<iterator_t<R>, O> &&
    uniform_random_bit_generator<remove_reference_t<Gen>>
O ranges::sample(R&& r, O out, range_difference_t<R> n, Gen&& g);
```

*Mandates:* For the overload in namespace `std`, `Distance` is an integer type and `*first` is writable (25.3.1) to `out`.

*Preconditions:* `out` is not in the range `[first, last)`. For the overload in namespace `std`:

- `PopulationIterator` meets the *Cpp17InputIterator* requirements (25.3.5.3).
- `SampleIterator` meets the *Cpp17OutputIterator* requirements (25.3.5.4).
- `SampleIterator` meets the *Cpp17RandomAccessIterator* requirements (25.3.5.7) unless `PopulationIterator` models *forward\_iterator* (25.3.4.11).
- `remove_reference_t<UniformRandomBitGenerator>` meets the requirements of a uniform random bit generator type (28.5.3.3).

*Effects:* Copies `min(last - first, n)` elements (the *sample*) from `[first, last)` (the *population*) to `out` such that each possible sample has equal probability of appearance.

NOTE Algorithms that obtain such effects include *selection sampling* and *reservoir sampling*.

*Returns:* The end of the resulting sample range.

*Complexity:*  $\mathcal{O}(\text{last} - \text{first})$ .

*Remarks:*

- For the overload in namespace `std`, stable if and only if `PopulationIterator` models *forward\_iterator*. For the first overload in namespace `ranges`, stable if and only if `I` models *forward\_iterator*.
- To the extent that the implementation of this function makes use of random numbers, the object `g` serves as the implementation's source of randomness.

### 27.7.13 Shuffle

[alg.random.shuffle]

```
template<class RandomAccessIterator, class UniformRandomBitGenerator>
void shuffle(RandomAccessIterator first,
            RandomAccessIterator last,
            UniformRandomBitGenerator&& g);

template<random_access_iterator I, sentinel_for<I> S, class Gen>
requires permutable<I> &&
    uniform_random_bit_generator<remove_reference_t<Gen>>
I ranges::shuffle(I first, S last, Gen&& g);
```

```
template<random_access_range R, class Gen>
requires permutable<iterator_t<R>> &&
    uniform_random_bit_generator<remove_reference_t<Gen>>
borrowed_iterator_t<R> ranges::shuffle(R&& r, Gen&& g);
```

*Preconditions:* For the overload in namespace `std`:

- `RandomAccessIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3).
- The type `remove_reference_t<UniformRandomBitGenerator>` meets the uniform random bit generator (28.5.3.3) requirements.

*Effects:* Permutes the elements in the range `[first, last)` such that each possible permutation of those elements has equal probability of appearance.

*Returns:* `last` for the overloads in namespace `ranges`.

*Complexity:* Exactly  $(last - first) - 1$  swaps.

*Remarks:* To the extent that the implementation of this function makes use of random numbers, the object referenced by `g` shall serve as the implementation's source of randomness.

## 27.7.14 Shift

[alg.shift]

```
template<class ForwardIterator>
constexpr ForwardIterator
    shift_left(ForwardIterator first, ForwardIterator last,
               typename iterator_traits<ForwardIterator>::difference_type n);
template<class ExecutionPolicy, class ForwardIterator>
ForwardIterator
    shift_left(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last,
               typename iterator_traits<ForwardIterator>::difference_type n);

template<permutable I, sentinel_for<I> S>
constexpr subrange<I> ranges::shift_left(I first, S last, iter_difference_t<I> n);
template<forward_range R>
requires permutable<iterator_t<R>>
constexpr borrowed_subrange_t<R> ranges::shift_left(R&& r, range_difference_t<R> n)
```

*Preconditions:*  $n \geq 0$  is true. For the overloads in namespace `std`, the type of `*first` meets the *Cpp17MoveAssignable* requirements.

*Effects:* If  $n == 0$  or  $n \geq last - first$ , does nothing. Otherwise, moves the element from position `first + n + i` into position `first + i` for each non-negative integer  $i < (last - first) - n$ . For the overloads without an `ExecutionPolicy` template parameter, does so in order starting from  $i = 0$  and proceeding to  $i = (last - first) - n - 1$ .

*Returns:* Let *NEW\_LAST* be `first + (last - first - n)` if  $n < last - first$ , otherwise `first`.

- *NEW\_LAST* for the overloads in namespace `std`.
- `{first, NEW_LAST}` for the overloads in namespace `ranges`.

*Complexity:* At most  $(last - first) - n$  assignments.

```
template<class ForwardIterator>
constexpr ForwardIterator
    shift_right(ForwardIterator first, ForwardIterator last,
                typename iterator_traits<ForwardIterator>::difference_type n);
template<class ExecutionPolicy, class ForwardIterator>
ForwardIterator
    shift_right(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last,
                typename iterator_traits<ForwardIterator>::difference_type n);

template<permutable I, sentinel_for<I> S>
constexpr subrange<I> ranges::shift_right(I first, S last, iter_difference_t<I> n);
template<forward_range R>
requires permutable<iterator_t<R>>
```

```
constexpr borrowed_subrange_t<R> ranges::shift_right(R&& r, range_difference_t<R> n);
```

*Preconditions:* `n >= 0` is true. For the overloads in namespace `std`, the type of `*first` meets the *Cpp17MoveAssignable* requirements, and `ForwardIterator` meets the *Cpp17BidirectionalIterator* requirements (25.3.5.6) or the *Cpp17ValueSwappable* requirements.

*Effects:* If `n == 0` or `n >= last - first`, does nothing. Otherwise, moves the element from position `first + i` into position `first + n + i` for each non-negative integer `i < (last - first) - n`. Does so in order starting from `i = (last - first) - n - 1` and proceeding to `i = 0` if

- for the overload in namespace `std` without an `ExecutionPolicy` template parameter, `ForwardIterator` meets the *Cpp17BidirectionalIterator* requirements,
- for the overloads in namespace `ranges`, `I` models `bidirectional_iterator`.

*Returns:* Let `NEW_FIRST` be `first + n` if `n < last - first`, otherwise `last`.

- `NEW_FIRST` for the overloads in namespace `std`.
- `{NEW_FIRST, last}` for the overloads in namespace `ranges`.

*Complexity:* At most  $(\text{last} - \text{first}) - n$  assignments or swaps.

## 27.8 Sorting and related operations

[alg.sorting]

### 27.8.1 General

[alg.sorting.general]

The operations in 27.8 defined directly in namespace `std` have two versions: one that takes a function object of type `Compare` and one that uses `operator<`.

`Compare` is a function object type (22.10) that meets the requirements for a template parameter named `BinaryPredicate` (27.2). The return value of the function call operation applied to an object of type `Compare`, when converted to `bool`, yields `true` if the first argument of the call is less than the second, and `false` otherwise. `Compare comp` is used throughout for algorithms assuming an ordering relation.

For all algorithms that take `Compare`, there is a version that uses `operator<` instead. That is, `comp(*i, *j) != false` defaults to `*i < *j != false`. For algorithms other than those described in 27.8.4, `comp` shall induce a strict weak ordering on the values.

The term *strict* refers to the requirement of an irreflexive relation (`!comp(x, x)` for all `x`), and the term *weak* to requirements that are not as strong as those for a total ordering, but stronger than those for a partial ordering. If we define `equiv(a, b)` as `!comp(a, b) && !comp(b, a)`, then the requirements are that `comp` and `equiv` both be transitive relations:

- `comp(a, b) && comp(b, c)` implies `comp(a, c)`
- `equiv(a, b) && equiv(b, c)` implies `equiv(a, c)`

NOTE Under these conditions, it can be shown that

- `equiv` is an equivalence relation,
- `comp` induces a well-defined relation on the equivalence classes determined by `equiv`, and
- the induced relation is a strict total ordering.

A sequence is *sorted with respect to a comp and proj* for a comparator and projection `comp` and `proj` if for every iterator `i` pointing to the sequence and every non-negative integer `n` such that `i + n` is a valid iterator pointing to an element of the sequence,

```
bool(invoke(comp, invoke(proj, *(i + n)), invoke(proj, *i)))
```

is false.

A sequence is *sorted with respect to a comparator comp* for a comparator `comp` if it is sorted with respect to `comp` and `identity{}` (the identity projection).

A sequence `[start, finish)` is *partitioned with respect to an expression f(e)* if there exists an integer `n` such that for all `0 <= i < (finish - start)`, `f(*(start + i))` is true if and only if `i < n`.

In the descriptions of the functions that deal with ordering relationships we frequently use a notion of equivalence to describe concepts such as stability. The equivalence to which we refer is not necessarily an `operator==`, but an equivalence relation induced by the strict weak ordering. That is, two elements `a` and `b` are considered equivalent if and only if `!(a < b) && !(b < a)`.

## 27.8.2 Sorting

[alg.sort]

### 27.8.2.1 sort

[sort]

```

template<class RandomAccessIterator>
constexpr void sort(RandomAccessIterator first, RandomAccessIterator last);
template<class ExecutionPolicy, class RandomAccessIterator>
void sort(ExecutionPolicy&& exec,
          RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
constexpr void sort(RandomAccessIterator first, RandomAccessIterator last,
                    Compare comp);
template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
void sort(ExecutionPolicy&& exec,
          RandomAccessIterator first, RandomAccessIterator last,
          Compare comp);

template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
        class Proj = identity>
requires sortable<I, Comp, Proj>
constexpr I
    ranges::sort(I first, S last, Comp comp = {}, Proj proj = {});
template<random_access_range R, class Comp = ranges::less, class Proj = identity>
requires sortable<iterator_t<R>, Comp, Proj>
constexpr borrowed_iterator_t<R>
    ranges::sort(R&& r, Comp comp = {}, Proj proj = {});

```

Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.

*Preconditions:* For the overloads in namespace `std`, `RandomAccessIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3) and the type of `*first` meets the *Cpp17MoveConstructible* (Table 31) and *Cpp17MoveAssignable* (Table 33) requirements.

*Effects:* Sorts the elements in the range `[first, last)` with respect to `comp` and `proj`.

*Returns:* `last` for the overloads in namespace `ranges`.

*Complexity:* Let  $N$  be `last - first`.  $O(N \log N)$  comparisons and projections.

### 27.8.2.2 stable\_sort

[stable.sort]

```

template<class RandomAccessIterator>
void stable_sort(RandomAccessIterator first, RandomAccessIterator last);
template<class ExecutionPolicy, class RandomAccessIterator>
void stable_sort(ExecutionPolicy&& exec,
                RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
void stable_sort(RandomAccessIterator first, RandomAccessIterator last,
                Compare comp);
template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
void stable_sort(ExecutionPolicy&& exec,
                RandomAccessIterator first, RandomAccessIterator last,
                Compare comp);

template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
        class Proj = identity>
requires sortable<I, Comp, Proj>
I ranges::stable_sort(I first, S last, Comp comp = {}, Proj proj = {});
template<random_access_range R, class Comp = ranges::less, class Proj = identity>
requires sortable<iterator_t<R>, Comp, Proj>
borrowed_iterator_t<R>
    ranges::stable_sort(R&& r, Comp comp = {}, Proj proj = {});

```

Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.

*Preconditions:* For the overloads in namespace `std`, `RandomAccessIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3) and the type of `*first` meets the *Cpp17MoveConstructible* (Table 31) and *Cpp17MoveAssignable* (Table 33) requirements.

*Effects:* Sorts the elements in the range `[first, last)` with respect to `comp` and `proj`.

*Returns:* `last` for the overloads in namespace `ranges`.

*Complexity:* Let  $N$  be `last - first`. If enough extra memory is available,  $N \log(N)$  comparisons. Otherwise, at most  $N \log^2(N)$  comparisons. In either case, twice as many projections as the number of comparisons.

*Remarks:* Stable (16.4.6.8).

### 27.8.2.3 `partial_sort`

[partial.sort]

```
template<class RandomAccessIterator>
constexpr void partial_sort(RandomAccessIterator first,
                           RandomAccessIterator middle,
                           RandomAccessIterator last);
template<class ExecutionPolicy, class RandomAccessIterator>
void partial_sort(ExecutionPolicy&& exec,
                  RandomAccessIterator first,
                  RandomAccessIterator middle,
                  RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
constexpr void partial_sort(RandomAccessIterator first,
                           RandomAccessIterator middle,
                           RandomAccessIterator last,
                           Compare comp);
template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
void partial_sort(ExecutionPolicy&& exec,
                  RandomAccessIterator first,
                  RandomAccessIterator middle,
                  RandomAccessIterator last,
                  Compare comp);

template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
        class Proj = identity>
requires sortable<I, Comp, Proj>
constexpr I
ranges::partial_sort(I first, I middle, S last, Comp comp = {}, Proj proj = {});
```

Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.

*Preconditions:* `[first, middle)` and `[middle, last)` are valid ranges. For the overloads in namespace `std`, `RandomAccessIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3) and the type of `*first` meets the *Cpp17MoveConstructible* (Table 31) and *Cpp17MoveAssignable* (Table 33) requirements.

*Effects:* Places the first `middle - first` elements from the range `[first, last)` as sorted with respect to `comp` and `proj` into the range `[first, middle)`. The rest of the elements in the range `[middle, last)` are placed in an unspecified order.

*Returns:* `last` for the overload in namespace `ranges`.

*Complexity:* Approximately  $(last - first) * \log(middle - first)$  comparisons, and twice as many projections.

```
template<random_access_range R, class Comp = ranges::less, class Proj = identity>
requires sortable<iterator_t<R>, Comp, Proj>
constexpr borrowed_iterator_t<R>
ranges::partial_sort(R&& r, iterator_t<R> middle, Comp comp = {}, Proj proj = {});
```

*Effects:* Equivalent to:

```
return ranges::partial_sort(ranges::begin(r), middle, ranges::end(r), comp, proj);
```

## 27.8.2.4 partial\_sort\_copy

[partial.sort.copy]

```

template<class InputIterator, class RandomAccessIterator>
constexpr RandomAccessIterator
    partial_sort_copy(InputIterator first, InputIterator last,
                      RandomAccessIterator result_first,
                      RandomAccessIterator result_last);
template<class ExecutionPolicy, class ForwardIterator, class RandomAccessIterator>
RandomAccessIterator
    partial_sort_copy(ExecutionPolicy&& exec,
                      ForwardIterator first, ForwardIterator last,
                      RandomAccessIterator result_first,
                      RandomAccessIterator result_last);

template<class InputIterator, class RandomAccessIterator,
         class Compare>
constexpr RandomAccessIterator
    partial_sort_copy(InputIterator first, InputIterator last,
                      RandomAccessIterator result_first,
                      RandomAccessIterator result_last,
                      Compare comp);
template<class ExecutionPolicy, class ForwardIterator, class RandomAccessIterator,
         class Compare>
RandomAccessIterator
    partial_sort_copy(ExecutionPolicy&& exec,
                      ForwardIterator first, ForwardIterator last,
                      RandomAccessIterator result_first,
                      RandomAccessIterator result_last,
                      Compare comp);

template<input_iterator I1, sentinel_for<I1> S1, random_access_iterator I2, sentinel_for<I2> S2,
         class Comp = ranges::less, class Proj1 = identity, class Proj2 = identity>
requires indirectly_copyable<I1, I2> && sortable<I2, Comp, Proj2> &&
    indirect_strict_weak_order<Comp, projected<I1, Proj1>, projected<I2, Proj2>>
constexpr ranges::partial_sort_copy_result<I1, I2>
    ranges::partial_sort_copy(I1 first, S1 last, I2 result_first, S2 result_last,
                              Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
template<input_range R1, random_access_range R2, class Comp = ranges::less,
         class Proj1 = identity, class Proj2 = identity>
requires indirectly_copyable<iterator_t<R1>, iterator_t<R2>> &&
    sortable<iterator_t<R2>, Comp, Proj2> &&
    indirect_strict_weak_order<Comp, projected<iterator_t<R1>, Proj1>,
                              projected<iterator_t<R2>, Proj2>>
constexpr ranges::partial_sort_copy_result<borrowed_iterator_t<R1>, borrowed_iterator_t<R2>>
    ranges::partial_sort_copy(R1&& r, R2&& result_r, Comp comp = {},
                              Proj1 proj1 = {}, Proj2 proj2 = {});

```

Let  $N$  be  $\min(\text{last} - \text{first}, \text{result\_last} - \text{result\_first})$ . Let  $\text{comp}$  be  $\text{less}\{\}$ , and  $\text{proj1}$  and  $\text{proj2}$  be  $\text{identity}\{\}$  for the overloads with no parameters by those names.

**Mandates:** For the overloads in namespace `std`, the expression `*first` is writable (25.3.1) to `result_first`.

**Preconditions:** For the overloads in namespace `std`, `RandomAccessIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3), the type of `*result_first` meets the *Cpp17MoveConstructible* (Table 31) and *Cpp17MoveAssignable* (Table 33) requirements.

For iterators  $a1$  and  $b1$  in  $[\text{first}, \text{last})$ , and iterators  $x2$  and  $y2$  in  $[\text{result\_first}, \text{result\_last})$ , after evaluating the assignment `*y2 = *b1`, let  $E$  be the value of

```
bool(invoker(comp, invoker(proj1, *a1), invoker(proj2, *y2))).
```

Then, after evaluating the assignment `*x2 = *a1`,  $E$  is equal to

```
bool(invoker(comp, invoker(proj2, *x2), invoker(proj2, *y2))).
```

**NOTE** Writing a value from the input range into the output range does not affect how it is ordered by `comp` and `proj1` or `proj2`.

*Effects:* Places the first  $N$  elements as sorted with respect to `comp` and `proj2` into the range `[result_first, result_first + N)`.

*Returns:*

- `result_first + N` for the overloads in namespace `std`.
- `{last, result_first + N}` for the overloads in namespace `ranges`.

*Complexity:* Approximately  $(last - first) * \log N$  comparisons, and twice as many projections.

### 27.8.2.5 `is_sorted`

[is.sorted]

```
template<class ForwardIterator>
constexpr bool is_sorted(ForwardIterator first, ForwardIterator last);

Effects: Equivalent to: return is_sorted_until(first, last) == last;

template<class ExecutionPolicy, class ForwardIterator>
bool is_sorted(ExecutionPolicy&& exec,
               ForwardIterator first, ForwardIterator last);

Effects: Equivalent to:

    return is_sorted_until(std::forward<ExecutionPolicy>(exec), first, last) == last;

template<class ForwardIterator, class Compare>
constexpr bool is_sorted(ForwardIterator first, ForwardIterator last,
                        Compare comp);

Effects: Equivalent to: return is_sorted_until(first, last, comp) == last;

template<class ExecutionPolicy, class ForwardIterator, class Compare>
bool is_sorted(ExecutionPolicy&& exec,
               ForwardIterator first, ForwardIterator last,
               Compare comp);

Effects: Equivalent to:

    return is_sorted_until(std::forward<ExecutionPolicy>(exec), first, last, comp) == last;

template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
        indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less>
constexpr bool ranges::is_sorted(I first, S last, Comp comp = {}, Proj proj = {});

template<forward_range R, class Proj = identity,
        indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
constexpr bool ranges::is_sorted(R&& r, Comp comp = {}, Proj proj = {});

Effects: Equivalent to: return ranges::is_sorted_until(first, last, comp, proj) == last;

template<class ForwardIterator>
constexpr ForwardIterator
    is_sorted_until(ForwardIterator first, ForwardIterator last);

template<class ExecutionPolicy, class ForwardIterator>
ForwardIterator
    is_sorted_until(ExecutionPolicy&& exec,
                   ForwardIterator first, ForwardIterator last);

template<class ForwardIterator, class Compare>
constexpr ForwardIterator
    is_sorted_until(ForwardIterator first, ForwardIterator last,
                   Compare comp);

template<class ExecutionPolicy, class ForwardIterator, class Compare>
ForwardIterator
    is_sorted_until(ExecutionPolicy&& exec,
                   ForwardIterator first, ForwardIterator last,
                   Compare comp);

template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
        indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less>
constexpr I ranges::is_sorted_until(I first, S last, Comp comp = {}, Proj proj = {});
```

```
template<forward_range R, class Proj = identity,
        indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
constexpr borrowed_iterator_t<R>
ranges::is_sorted_until(R&& r, Comp comp = {}, Proj proj = {});
```

Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.

*Returns:* The last iterator `i` in `[first, last]` for which the range `[first, i)` is sorted with respect to `comp` and `proj`.

*Complexity:* Linear.

### 27.8.3 Nth element

[alg.nth.element]

```
template<class RandomAccessIterator>
constexpr void nth_element(RandomAccessIterator first, RandomAccessIterator nth,
                          RandomAccessIterator last);
template<class ExecutionPolicy, class RandomAccessIterator>
void nth_element(ExecutionPolicy&& exec,
                RandomAccessIterator first, RandomAccessIterator nth,
                RandomAccessIterator last);
```

```
template<class RandomAccessIterator, class Compare>
constexpr void nth_element(RandomAccessIterator first, RandomAccessIterator nth,
                          RandomAccessIterator last, Compare comp);
template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
void nth_element(ExecutionPolicy&& exec,
                RandomAccessIterator first, RandomAccessIterator nth,
                RandomAccessIterator last, Compare comp);
```

```
template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
        class Proj = identity>
requires sortable<I, Comp, Proj>
constexpr I
ranges::nth_element(I first, I nth, S last, Comp comp = {}, Proj proj = {});
```

Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.

*Preconditions:* `[first, nth)` and `[nth, last)` are valid ranges. For the overloads in namespace `std`, `RandomAccessIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3), and the type of `*first` meets the *Cpp17MoveConstructible* (Table 31) and *Cpp17MoveAssignable* (Table 33) requirements.

*Effects:* After `nth_element` the element in the position pointed to by `nth` is the element that would be in that position if the whole range were sorted with respect to `comp` and `proj`, unless `nth == last`. Also for every iterator `i` in the range `[first, nth)` and every iterator `j` in the range `[nth, last)` it holds that: `bool(invoker(comp, invoker(proj, *j), invoker(proj, *i)))` is false.

*Returns:* `last` for the overload in namespace `ranges`.

*Complexity:* For the overloads with no `ExecutionPolicy`, linear on average. For the overloads with an `ExecutionPolicy`,  $\mathcal{O}(N)$  applications of the predicate, and  $\mathcal{O}(N \log N)$  swaps, where  $N = \text{last} - \text{first}$ .

```
template<random_access_range R, class Comp = ranges::less, class Proj = identity>
requires sortable<iterator_t<R>, Comp, Proj>
constexpr borrowed_iterator_t<R>
ranges::nth_element(R&& r, iterator_t<R> nth, Comp comp = {}, Proj proj = {});
```

*Effects:* Equivalent to:

```
return ranges::nth_element(ranges::begin(r), nth, ranges::end(r), comp, proj);
```

### 27.8.4 Binary search

[alg.binary.search]

#### 27.8.4.1 General

[alg.binary.search.general]

All of the algorithms in 27.8.4 are versions of binary search and assume that the sequence being searched is partitioned with respect to an expression formed by binding the search key to an argument of the comparison function. They work on non-random access iterators minimizing the number of comparisons, which will be

logarithmic for all types of iterators. They are especially appropriate for random access iterators, because these algorithms do a logarithmic number of steps through the data structure. For non-random access iterators they execute a linear number of steps.

#### 27.8.4.2 lower\_bound

[lower\_bound]

```
template<class ForwardIterator, class T>
constexpr ForwardIterator
    lower_bound(ForwardIterator first, ForwardIterator last,
                const T& value);

template<class ForwardIterator, class T, class Compare>
constexpr ForwardIterator
    lower_bound(ForwardIterator first, ForwardIterator last,
                const T& value, Compare comp);

template<forward_iterator I, sentinel_for<I> S, class T, class Proj = identity,
        indirect_strict_weak_order<const T*, projected<I, Proj>> Comp = ranges::less>
constexpr I ranges::lower_bound(I first, S last, const T& value, Comp comp = {},
                                Proj proj = {});

template<forward_range R, class T, class Proj = identity,
        indirect_strict_weak_order<const T*, projected<iterator_t<R>, Proj>> Comp =
        ranges::less>
constexpr borrowed_iterator_t<R>
    ranges::lower_bound(R&& r, const T& value, Comp comp = {}, Proj proj = {});
```

Let `comp` be `less{}` and `proj` be `identity{}` for overloads with no parameters by those names.

*Preconditions:* The elements `e` of `[first, last)` are partitioned with respect to the expression `bool(invoker(comp, invoker(proj, e), value))`.

*Returns:* The furthestmost iterator `i` in the range `[first, last]` such that for every iterator `j` in the range `[first, i)`, `bool(invoker(comp, invoker(proj, *j), value))` is true.

*Complexity:* At most  $\log_2(\text{last} - \text{first}) + \mathcal{O}(1)$  comparisons and projections.

#### 27.8.4.3 upper\_bound

[upper\_bound]

```
template<class ForwardIterator, class T>
constexpr ForwardIterator
    upper_bound(ForwardIterator first, ForwardIterator last,
                const T& value);

template<class ForwardIterator, class T, class Compare>
constexpr ForwardIterator
    upper_bound(ForwardIterator first, ForwardIterator last,
                const T& value, Compare comp);

template<forward_iterator I, sentinel_for<I> S, class T, class Proj = identity,
        indirect_strict_weak_order<const T*, projected<I, Proj>> Comp = ranges::less>
constexpr I ranges::upper_bound(I first, S last, const T& value, Comp comp = {}, Proj proj = {});

template<forward_range R, class T, class Proj = identity,
        indirect_strict_weak_order<const T*, projected<iterator_t<R>, Proj>> Comp =
        ranges::less>
constexpr borrowed_iterator_t<R>
    ranges::upper_bound(R&& r, const T& value, Comp comp = {}, Proj proj = {});
```

Let `comp` be `less{}` and `proj` be `identity{}` for overloads with no parameters by those names.

*Preconditions:* The elements `e` of `[first, last)` are partitioned with respect to the expression `!bool(invoker(comp, value, invoker(proj, e)))`.

*Returns:* The furthestmost iterator `i` in the range `[first, last]` such that for every iterator `j` in the range `[first, i)`, `!bool(invoker(comp, value, invoker(proj, *j)))` is true.

*Complexity:* At most  $\log_2(\text{last} - \text{first}) + \mathcal{O}(1)$  comparisons and projections.

## 27.8.4.4 equal\_range

[equal.range]

```

template<class ForwardIterator, class T>
constexpr pair<ForwardIterator, ForwardIterator>
equal_range(ForwardIterator first,
            ForwardIterator last, const T& value);

template<class ForwardIterator, class T, class Compare>
constexpr pair<ForwardIterator, ForwardIterator>
equal_range(ForwardIterator first,
            ForwardIterator last, const T& value,
            Compare comp);

template<forward_iterator I, sentinel_for<I> S, class T, class Proj = identity,
        indirect_strict_weak_order<const T*, projected<I, Proj>> Comp = ranges::less>
constexpr subrange<I>
ranges::equal_range(I first, S last, const T& value, Comp comp = {}, Proj proj = {});
template<forward_range R, class T, class Proj = identity,
        indirect_strict_weak_order<const T*, projected<iterator_t<R>, Proj>> Comp =
        ranges::less>
constexpr borrowed_subrange_t<R>
ranges::equal_range(R&& r, const T& value, Comp comp = {}, Proj proj = {});

```

Let comp be less{} and proj be identity{} for overloads with no parameters by those names.

*Preconditions:* The elements e of [first,last) are partitioned with respect to the expressions bool(invoker(comp, invoker(proj, e), value)) and !bool(invoker(comp, value, invoker(proj, e))). Also, for all elements e of [first, last), bool(comp(e, value)) implies !bool(comp(value, e)) for the overloads in namespace std.

*Returns:*

- For the overloads in namespace std:

```

{lower_bound(first, last, value, comp),
 upper_bound(first, last, value, comp)}

```

- For the overloads in namespace ranges:

```

{ranges::lower_bound(first, last, value, comp, proj),
 ranges::upper_bound(first, last, value, comp, proj)}

```

*Complexity:* At most  $2 * \log_2(\text{last} - \text{first}) + \mathcal{O}(1)$  comparisons and projections.

## 27.8.4.5 binary\_search

[binary.search]

```

template<class ForwardIterator, class T>
constexpr bool
binary_search(ForwardIterator first, ForwardIterator last,
            const T& value);

template<class ForwardIterator, class T, class Compare>
constexpr bool
binary_search(ForwardIterator first, ForwardIterator last,
            const T& value, Compare comp);

template<forward_iterator I, sentinel_for<I> S, class T, class Proj = identity,
        indirect_strict_weak_order<const T*, projected<I, Proj>> Comp = ranges::less>
constexpr bool ranges::binary_search(I first, S last, const T& value, Comp comp = {},
        Proj proj = {});
template<forward_range R, class T, class Proj = identity,
        indirect_strict_weak_order<const T*, projected<iterator_t<R>, Proj>> Comp =
        ranges::less>
constexpr bool ranges::binary_search(R&& r, const T& value, Comp comp = {},
        Proj proj = {});

```

Let comp be less{} and proj be identity{} for overloads with no parameters by those names.

*Preconditions:* The elements e of [first,last) are partitioned with respect to the expressions bool(invoker(comp, invoker(proj, e), value)) and !bool(invoker(comp, value, invoker(proj, e))).

e))). Also, for all elements *e* of  $[first, last)$ ,  $bool(comp(e, value))$  implies  $!bool(comp(value, e))$  for the overloads in namespace `std`.

*Returns:* true if and only if for some iterator *i* in the range  $[first, last)$ ,  $!bool(invoke(comp, invoke(proj, *i), value)) \&\& !bool(invoke(comp, value, invoke(proj, *i)))$  is true.

*Complexity:* At most  $\log_2(last - first) + \mathcal{O}(1)$  comparisons and projections.

## 27.8.5 Partitions

[alg.partitions]

```
template<class InputIterator, class Predicate>
constexpr bool is_partitioned(InputIterator first, InputIterator last, Predicate pred);
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
bool is_partitioned(ExecutionPolicy&& exec,
                   ForwardIterator first, ForwardIterator last, Predicate pred);
```

```
template<input_iterator I, sentinel_for<I> S, class Proj = identity,
        indirect_unary_predicate<projected<I, Proj>> Pred>
constexpr bool ranges::is_partitioned(I first, S last, Pred pred, Proj proj = {});
template<input_range R, class Proj = identity,
        indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
constexpr bool ranges::is_partitioned(R&& r, Pred pred, Proj proj = {});
```

Let `proj` be `identity{}` for the overloads with no parameter named `proj`.

*Returns:* true if and only if the elements *e* of  $[first, last)$  are partitioned with respect to the expression  $bool(invoke(pred, invoke(proj, e)))$ .

*Complexity:* Linear. At most  $last - first$  applications of `pred` and `proj`.

```
template<class ForwardIterator, class Predicate>
constexpr ForwardIterator
partition(ForwardIterator first, ForwardIterator last, Predicate pred);
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
ForwardIterator
partition(ExecutionPolicy&& exec,
         ForwardIterator first, ForwardIterator last, Predicate pred);
```

```
template<permutable I, sentinel_for<I> S, class Proj = identity,
        indirect_unary_predicate<projected<I, Proj>> Pred>
constexpr subrange<I>
ranges::partition(I first, S last, Pred pred, Proj proj = {});
template<forward_range R, class Proj = identity,
        indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
requires permutable<iterator_t<R>>
constexpr borrowed_subrange_t<R>
ranges::partition(R&& r, Pred pred, Proj proj = {});
```

Let `proj` be `identity{}` for the overloads with no parameter named `proj` and let  $E(x)$  be  $bool(invoke(pred, invoke(proj, x)))$ .

*Preconditions:* For the overloads in namespace `std`, `ForwardIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3).

*Effects:* Places all the elements *e* in  $[first, last)$  that satisfy  $E(e)$  before all the elements that do not.

*Returns:* Let *i* be an iterator such that  $E(*j)$  is true for every iterator *j* in  $[first, i)$  and false for every iterator *j* in  $[i, last)$ . Returns:

- *i* for the overloads in namespace `std`.
- $\{i, last\}$  for the overloads in namespace `ranges`.

*Complexity:* Let  $N = last - first$ :

- For the overload with no `ExecutionPolicy`, exactly  $N$  applications of the predicate and projection. At most  $N/2$  swaps if the type of `first` meets the *Cpp17BidirectionalIterator* requirements for the overloads in namespace `std` or models `bidirectional_iterator` for the overloads in namespace `ranges`, and at most  $N$  swaps otherwise.

- For the overload with an `ExecutionPolicy`,  $\mathcal{O}(N \log N)$  swaps and  $\mathcal{O}(N)$  applications of the predicate.

```
template<class BidirectionalIterator, class Predicate>
    BidirectionalIterator
        stable_partition(BidirectionalIterator first, BidirectionalIterator last, Predicate pred);
template<class ExecutionPolicy, class BidirectionalIterator, class Predicate>
    BidirectionalIterator
        stable_partition(ExecutionPolicy&& exec,
                        BidirectionalIterator first, BidirectionalIterator last, Predicate pred);

template<bidirectional_iterator I, sentinel_for<I> S, class Proj = identity,
        indirect_unary_predicate<projected<I, Proj>> Pred>
    requires permutable<I>
    subrange<I> ranges::stable_partition(I first, S last, Pred pred, Proj proj = {});
template<bidirectional_range R, class Proj = identity,
        indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
    requires permutable<iterator_t<R>>
    borrowed_subrange_t<R> ranges::stable_partition(R&& r, Pred pred, Proj proj = {});
```

Let `proj` be `identity{}` for the overloads with no parameter named `proj` and let  $E(x)$  be `bool(invoker(pred, invoker(proj, x))).`

*Preconditions:* For the overloads in namespace `std`, `BidirectionalIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3) and the type of `*first` meets the *Cpp17MoveConstructible* (Table 31) and *Cpp17MoveAssignable* (Table 33) requirements.

*Effects:* Places all the elements `e` in `[first, last)` that satisfy  $E(e)$  before all the elements that do not. The relative order of the elements in both groups is preserved.

*Returns:* Let `i` be an iterator such that for every iterator `j` in `[first, i)`,  $E(*j)$  is true, and for every iterator `j` in the range `[i, last)`,  $E(*j)$  is false. Returns:

- `i` for the overloads in namespace `std`.
- `{i, last}` for the overloads in namespace `ranges`.

*Complexity:* Let  $N = \text{last} - \text{first}$ :

- For the overloads with no `ExecutionPolicy`, at most  $N \log_2 N$  swaps, but only  $\mathcal{O}(N)$  swaps if there is enough extra memory. Exactly  $N$  applications of the predicate and projection.
- For the overload with an `ExecutionPolicy`,  $\mathcal{O}(N \log N)$  swaps and  $\mathcal{O}(N)$  applications of the predicate.

```
template<class InputIterator, class OutputIterator1, class OutputIterator2, class Predicate>
    constexpr pair<OutputIterator1, OutputIterator2>
        partition_copy(InputIterator first, InputIterator last,
                      OutputIterator1 out_true, OutputIterator2 out_false, Predicate pred);
template<class ExecutionPolicy, class ForwardIterator, class ForwardIterator1,
        class ForwardIterator2, class Predicate>
    pair<ForwardIterator1, ForwardIterator2>
        partition_copy(ExecutionPolicy&& exec,
                      ForwardIterator first, ForwardIterator last,
                      ForwardIterator1 out_true, ForwardIterator2 out_false, Predicate pred);

template<input_iterator I, sentinel_for<I> S, weakly_incremtable O1, weakly_incremtable O2,
        class Proj = identity, indirect_unary_predicate<projected<I, Proj>> Pred>
    requires indirectly_copyable<I, O1> && indirectly_copyable<I, O2>
    constexpr ranges::partition_copy_result<I, O1, O2>
        ranges::partition_copy(I first, S last, O1 out_true, O2 out_false, Pred pred,
                              Proj proj = {});
template<input_range R, weakly_incremtable O1, weakly_incremtable O2,
        class Proj = identity,
        indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
    requires indirectly_copyable<iterator_t<R>, O1> &&
        indirectly_copyable<iterator_t<R>, O2>
    constexpr ranges::partition_copy_result<borrowed_iterator_t<R>, O1, O2>
```

```
ranges::partition_copy(R&& r, 01 out_true, 02 out_false, Pred pred, Proj proj = {});
```

Let `proj` be `identity{}` for the overloads with no parameter named `proj` and let  $E(x)$  be `bool(invoker(pred, invoke(proj, x)))`.

*Mandates:* For the overloads in namespace `std`, the expression `*first` is writable (25.3.1) to `out_true` and `out_false`.

*Preconditions:* The input range and output ranges do not overlap.

NOTE For the overload with an `ExecutionPolicy`, a performance cost is possible if `first`'s value type does not meet the *Cpp17CopyConstructible* requirements.

*Effects:* For each iterator `i` in `[first, last)`, copies `*i` to the output range beginning with `out_true` if  $E(*i)$  is `true`, or to the output range beginning with `out_false` otherwise.

*Returns:* Let `o1` be the end of the output range beginning at `out_true`, and `o2` the end of the output range beginning at `out_false`. Returns

- `{o1, o2}` for the overloads in namespace `std`.
- `{last, o1, o2}` for the overloads in namespace `ranges`.

*Complexity:* Exactly `last - first` applications of `pred` and `proj`.

```
template<class ForwardIterator, class Predicate>
constexpr ForwardIterator
partition_point(ForwardIterator first, ForwardIterator last, Predicate pred);
```

```
template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
        indirect_unary_predicate<projected<I, Proj>> Pred>
constexpr I ranges::partition_point(I first, S last, Pred pred, Proj proj = {});
template<forward_range R, class Proj = identity,
        indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
constexpr borrowed_iterator_t<R>
ranges::partition_point(R&& r, Pred pred, Proj proj = {});
```

Let `proj` be `identity{}` for the overloads with no parameter named `proj` and let  $E(x)$  be `bool(invoker(pred, invoke(proj, x)))`.

*Preconditions:* The elements `e` of `[first, last)` are partitioned with respect to  $E(e)$ .

*Returns:* An iterator `mid` such that  $E(*i)$  is `true` for all iterators `i` in `[first, mid)`, and `false` for all iterators `i` in `[mid, last)`.

*Complexity:*  $\mathcal{O}(\log(\text{last} - \text{first}))$  applications of `pred` and `proj`.

## 27.8.6 Merge

[alg.merge]

```
template<class InputIterator1, class InputIterator2,
        class OutputIterator>
constexpr OutputIterator
merge(InputIterator1 first1, InputIterator1 last1,
      InputIterator2 first2, InputIterator2 last2,
      OutputIterator result);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
        class ForwardIterator>
ForwardIterator
merge(ExecutionPolicy&& exec,
      ForwardIterator1 first1, ForwardIterator1 last1,
      ForwardIterator2 first2, ForwardIterator2 last2,
      ForwardIterator result);

template<class InputIterator1, class InputIterator2,
        class OutputIterator, class Compare>
constexpr OutputIterator
merge(InputIterator1 first1, InputIterator1 last1,
      InputIterator2 first2, InputIterator2 last2,
      OutputIterator result, Compare comp);
```

```

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
        class ForwardIterator, class Compare>
ForwardIterator
merge(ExecutionPolicy&& exec,
      ForwardIterator1 first1, ForwardIterator1 last1,
      ForwardIterator2 first2, ForwardIterator2 last2,
      ForwardIterator result, Compare comp);

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
        weakly_incremtable O, class Comp = ranges::less, class Proj1 = identity,
        class Proj2 = identity>
requires mergeable<I1, I2, O, Comp, Proj1, Proj2>
constexpr ranges::merge_result<I1, I2, O>
ranges::merge(I1 first1, S1 last1, I2 first2, S2 last2, O result,
              Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});

template<input_range R1, input_range R2, weakly_incremtable O, class Comp = ranges::less,
        class Proj1 = identity, class Proj2 = identity>
requires mergeable<iterator_t<R1>, iterator_t<R2>, O, Comp, Proj1, Proj2>
constexpr ranges::merge_result<borrowed_iterator_t<R1>, borrowed_iterator_t<R2>, O>
ranges::merge(R1&& r1, R2&& r2, O result,
              Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});

```

Let  $N$  be  $(last1 - first1) + (last2 - first2)$ . Let `comp` be `less{}`, `proj1` be `identity{}`, and `proj2` be `identity{}`, for the overloads with no parameters by those names.

*Preconditions:* The ranges  $[first1, last1)$  and  $[first2, last2)$  are sorted with respect to `comp` and `proj1` or `proj2`, respectively. The resulting range does not overlap with either of the original ranges.

*Effects:* Copies all the elements of the two ranges  $[first1, last1)$  and  $[first2, last2)$  into the range  $[result, result\_last)$ , where `result\_last` is `result + N`. If an element `a` precedes `b` in an input range, `a` is copied into the output range before `b`. If `e1` is an element of  $[first1, last1)$  and `e2` of  $[first2, last2)$ , `e2` is copied into the output range before `e1` if and only if `bool(invoker(comp, invoker(proj2, e2), invoker(proj1, e1)))` is `true`.

*Returns:*

- `result\_last` for the overloads in namespace `std`.
- `{last1, last2, result\_last}` for the overloads in namespace `ranges`.

*Complexity:*

- For the overloads with no `ExecutionPolicy`, at most  $N - 1$  comparisons and applications of each projection.
- For the overloads with an `ExecutionPolicy`,  $\mathcal{O}(N)$  comparisons.

*Remarks:* Stable (16.4.6.8).

```

template<class BidirectionalIterator>
void inplace_merge(BidirectionalIterator first,
                  BidirectionalIterator middle,
                  BidirectionalIterator last);

template<class ExecutionPolicy, class BidirectionalIterator>
void inplace_merge(ExecutionPolicy&& exec,
                  BidirectionalIterator first,
                  BidirectionalIterator middle,
                  BidirectionalIterator last);

template<class BidirectionalIterator, class Compare>
void inplace_merge(BidirectionalIterator first,
                  BidirectionalIterator middle,
                  BidirectionalIterator last, Compare comp);

template<class ExecutionPolicy, class BidirectionalIterator, class Compare>
void inplace_merge(ExecutionPolicy&& exec,
                  BidirectionalIterator first,
                  BidirectionalIterator middle,
                  BidirectionalIterator last, Compare comp);

```

```
template<bidirectional_iterator I, sentinel_for<I> S, class Comp = ranges::less,
        class Proj = identity>
requires sortable<I, Comp, Proj>
I ranges::inplace_merge(I first, I middle, S last, Comp comp = {}, Proj proj = {});
```

Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.

*Preconditions:* `[first,middle)` and `[middle,last)` are valid ranges sorted with respect to `comp` and `proj`. For the overloads in namespace `std`, `BidirectionalIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3) and the type of `*first` meets the *Cpp17MoveConstructible* (Table 31) and *Cpp17MoveAssignable* (Table 33) requirements.

*Effects:* Merges two sorted consecutive ranges `[first,middle)` and `[middle,last)`, putting the result of the merge into the range `[first,last)`. The resulting range is sorted with respect to `comp` and `proj`.

*Returns:* `last` for the overload in namespace `ranges`.

*Complexity:* Let  $N = \text{last} - \text{first}$ :

- For the overloads with no `ExecutionPolicy`, and if enough additional memory is available, exactly  $N - 1$  comparisons.
- Otherwise,  $\mathcal{O}(N \log N)$  comparisons.

In either case, twice as many projections as comparisons.

*Remarks:* Stable (16.4.6.8).

```
template<bidirectional_range R, class Comp = ranges::less, class Proj = identity>
requires sortable<iterator_t<R>, Comp, Proj>
borrowed_iterator_t<R>
ranges::inplace_merge(R&& r, iterator_t<R> middle, Comp comp = {}, Proj proj = {});
```

*Effects:* Equivalent to:

```
return ranges::inplace_merge(ranges::begin(r), middle, ranges::end(r), comp, proj);
```

## 27.8.7 Set operations on sorted structures [alg.set.operations]

### 27.8.7.1 General [alg.set.operations.general]

Subclause 27.8.7 defines all the basic set operations on sorted structures. They also work with `multisets` (24.4.7) containing multiple copies of equivalent elements. The semantics of the set operations are generalized to `multisets` in a standard way by defining `set_union` to contain the maximum number of occurrences of every element, `set_intersection` to contain the minimum, and so on.

### 27.8.7.2 includes [includes]

```
template<class InputIterator1, class InputIterator2>
constexpr bool includes(InputIterator1 first1, InputIterator1 last1,
                        InputIterator2 first2, InputIterator2 last2);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
bool includes(ExecutionPolicy&& exec,
              ForwardIterator1 first1, ForwardIterator1 last1,
              ForwardIterator2 first2, ForwardIterator2 last2);

template<class InputIterator1, class InputIterator2, class Compare>
constexpr bool includes(InputIterator1 first1, InputIterator1 last1,
                        InputIterator2 first2, InputIterator2 last2,
                        Compare comp);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, class Compare>
bool includes(ExecutionPolicy&& exec,
              ForwardIterator1 first1, ForwardIterator1 last1,
              ForwardIterator2 first2, ForwardIterator2 last2,
              Compare comp);

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
        class Proj1 = identity, class Proj2 = identity,
        indirect_strict_weak_order<projected<I1, Proj1>,
                                   projected<I2, Proj2>> Comp = ranges::less>
constexpr bool ranges::includes(I1 first1, S1 last1, I2 first2, S2 last2, Comp comp = {};
```

```

        Proj1 proj1 = {}, Proj2 proj2 = {});
template<input_range R1, input_range R2, class Proj1 = identity,
        class Proj2 = identity,
        indirect_strict_weak_order<projected<iterator_t<R1>, Proj1>,
        projected<iterator_t<R2>, Proj2>> Comp = ranges::less>
constexpr bool ranges::includes(R1&& r1, R2&& r2, Comp comp = {},
        Proj1 proj1 = {}, Proj2 proj2 = {});

```

Let `comp` be `less{}`, `proj1` be `identity{}`, and `proj2` be `identity{}`, for the overloads with no parameters by those names.

*Preconditions:* The ranges `[first1, last1)` and `[first2, last2)` are sorted with respect to `comp` and `proj1` or `proj2`, respectively.

*Returns:* `true` if and only if `[first2, last2)` is a subsequence of `[first1, last1)`.

NOTE A sequence *S* is a subsequence of another sequence *T* if *S* can be obtained from *T* by removing some, all, or none of *T*'s elements and keeping the remaining elements in the same order.

*Complexity:* At most  $2 * ((last1 - first1) + (last2 - first2)) - 1$  comparisons and applications of each projection.

### 27.8.7.3 set\_union

[set.union]

```

template<class InputIterator1, class InputIterator2, class OutputIterator>
constexpr OutputIterator
    set_union(InputIterator1 first1, InputIterator1 last1,
              InputIterator2 first2, InputIterator2 last2,
              OutputIterator result);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
        class ForwardIterator>
ForwardIterator
    set_union(ExecutionPolicy&& exec,
              ForwardIterator1 first1, ForwardIterator1 last1,
              ForwardIterator2 first2, ForwardIterator2 last2,
              ForwardIterator result);

template<class InputIterator1, class InputIterator2, class OutputIterator, class Compare>
constexpr OutputIterator
    set_union(InputIterator1 first1, InputIterator1 last1,
              InputIterator2 first2, InputIterator2 last2,
              OutputIterator result, Compare comp);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
        class ForwardIterator, class Compare>
ForwardIterator
    set_union(ExecutionPolicy&& exec,
              ForwardIterator1 first1, ForwardIterator1 last1,
              ForwardIterator2 first2, ForwardIterator2 last2,
              ForwardIterator result, Compare comp);

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
        weakly_incrementable O, class Comp = ranges::less,
        class Proj1 = identity, class Proj2 = identity>
requires mergeable<I1, I2, O, Comp, Proj1, Proj2>
constexpr ranges::set_union_result<I1, I2, O>
    ranges::set_union(I1 first1, S1 last1, I2 first2, S2 last2, O result, Comp comp = {},
                      Proj1 proj1 = {}, Proj2 proj2 = {});
template<input_range R1, input_range R2, weakly_incrementable O,
        class Comp = ranges::less, class Proj1 = identity, class Proj2 = identity>
requires mergeable<iterator_t<R1>, iterator_t<R2>, O, Comp, Proj1, Proj2>
constexpr ranges::set_union_result<borrowed_iterator_t<R1>, borrowed_iterator_t<R2>, O>
    ranges::set_union(R1&& r1, R2&& r2, O result, Comp comp = {},
                      Proj1 proj1 = {}, Proj2 proj2 = {});

```

Let `comp` be `less{}`, and `proj1` and `proj2` be `identity{}` for the overloads with no parameters by those names.

*Preconditions:* The ranges  $[first1, last1)$  and  $[first2, last2)$  are sorted with respect to `comp` and `proj1` or `proj2`, respectively. The resulting range does not overlap with either of the original ranges.

*Effects:* Constructs a sorted union of the elements from the two ranges; that is, the set of elements that are present in one or both of the ranges.

*Returns:* Let `result_last` be the end of the constructed range. Returns

- `result_last` for the overloads in namespace `std`.
- $\{last1, last2, result\_last\}$  for the overloads in namespace `ranges`.

*Complexity:* At most  $2 * ((last1 - first1) + (last2 - first2)) - 1$  comparisons and applications of each projection.

*Remarks:* Stable (16.4.6.8). If  $[first1, last1)$  contains  $m$  elements that are equivalent to each other and  $[first2, last2)$  contains  $n$  elements that are equivalent to them, then all  $m$  elements from the first range are copied to the output range, in order, and then the final  $\max(n - m, 0)$  elements from the second range are copied to the output range, in order.

#### 27.8.7.4 `set_intersection`

[`set.intersection`]

```
template<class InputIterator1, class InputIterator2,
        class OutputIterator>
constexpr OutputIterator
    set_intersection(InputIterator1 first1, InputIterator1 last1,
                    InputIterator2 first2, InputIterator2 last2,
                    OutputIterator result);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
        class ForwardIterator>
ForwardIterator
    set_intersection(ExecutionPolicy&& exec,
                    ForwardIterator1 first1, ForwardIterator1 last1,
                    ForwardIterator2 first2, ForwardIterator2 last2,
                    ForwardIterator result);

template<class InputIterator1, class InputIterator2,
        class OutputIterator, class Compare>
constexpr OutputIterator
    set_intersection(InputIterator1 first1, InputIterator1 last1,
                    InputIterator2 first2, InputIterator2 last2,
                    OutputIterator result, Compare comp);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
        class ForwardIterator, class Compare>
ForwardIterator
    set_intersection(ExecutionPolicy&& exec,
                    ForwardIterator1 first1, ForwardIterator1 last1,
                    ForwardIterator2 first2, ForwardIterator2 last2,
                    ForwardIterator result, Compare comp);

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
        weakly_incrementable O, class Comp = ranges::less,
        class Proj1 = identity, class Proj2 = identity>
requires mergeable<I1, I2, O, Comp, Proj1, Proj2>
constexpr ranges::set_intersection_result<I1, I2, O>
    ranges::set_intersection(I1 first1, S1 last1, I2 first2, S2 last2, O result,
                            Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});

template<input_range R1, input_range R2, weakly_incrementable O,
        class Comp = ranges::less, class Proj1 = identity, class Proj2 = identity>
requires mergeable<iterator_t<R1>, iterator_t<R2>, O, Comp, Proj1, Proj2>
constexpr ranges::set_intersection_result<borrowed_iterator_t<R1>, borrowed_iterator_t<R2>, O>
    ranges::set_intersection(R1&& r1, R2&& r2, O result,
                            Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
```

Let `comp` be `less{}`, and `proj1` and `proj2` be `identity{}` for the overloads with no parameters by those names.

*Preconditions:* The ranges  $[first1, last1)$  and  $[first2, last2)$  are sorted with respect to `comp` and `proj1` or `proj2`, respectively. The resulting range does not overlap with either of the original ranges.

*Effects:* Constructs a sorted intersection of the elements from the two ranges; that is, the set of elements that are present in both of the ranges.

*Returns:* Let `result_last` be the end of the constructed range. Returns

- `result_last` for the overloads in namespace `std`.
- $\{last1, last2, result\_last\}$  for the overloads in namespace `ranges`.

*Complexity:* At most  $2 * ((last1 - first1) + (last2 - first2)) - 1$  comparisons and applications of each projection.

*Remarks:* Stable (16.4.6.8). If  $[first1, last1)$  contains  $m$  elements that are equivalent to each other and  $[first2, last2)$  contains  $n$  elements that are equivalent to them, the first  $\min(m, n)$  elements are copied from the first range to the output range, in order.

#### 27.8.7.5 `set_difference`

[`set.difference`]

```
template<class InputIterator1, class InputIterator2,
        class OutputIterator>
constexpr OutputIterator
    set_difference(InputIterator1 first1, InputIterator1 last1,
                  InputIterator2 first2, InputIterator2 last2,
                  OutputIterator result);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
        class ForwardIterator>
ForwardIterator
    set_difference(ExecutionPolicy&& exec,
                  ForwardIterator1 first1, ForwardIterator1 last1,
                  ForwardIterator2 first2, ForwardIterator2 last2,
                  ForwardIterator result);

template<class InputIterator1, class InputIterator2,
        class OutputIterator, class Compare>
constexpr OutputIterator
    set_difference(InputIterator1 first1, InputIterator1 last1,
                  InputIterator2 first2, InputIterator2 last2,
                  OutputIterator result, Compare comp);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
        class ForwardIterator, class Compare>
ForwardIterator
    set_difference(ExecutionPolicy&& exec,
                  ForwardIterator1 first1, ForwardIterator1 last1,
                  ForwardIterator2 first2, ForwardIterator2 last2,
                  ForwardIterator result, Compare comp);

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
        weakly_incremmentable O, class Comp = ranges::less,
        class Proj1 = identity, class Proj2 = identity>
requires mergeable<I1, I2, O, Comp, Proj1, Proj2>
constexpr ranges::set_difference_result<I1, O>
    ranges::set_difference(I1 first1, S1 last1, I2 first2, S2 last2, O result,
                          Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});

template<input_range R1, input_range R2, weakly_incremmentable O,
        class Comp = ranges::less, class Proj1 = identity, class Proj2 = identity>
requires mergeable<iterator_t<R1>, iterator_t<R2>, O, Comp, Proj1, Proj2>
constexpr ranges::set_difference_result<borrowed_iterator_t<R1>, O>
    ranges::set_difference(R1&& r1, R2&& r2, O result,
                          Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
```

Let `comp` be `less{}`, and `proj1` and `proj2` be `identity{}` for the overloads with no parameters by those names.

*Preconditions:* The ranges  $[first1, last1)$  and  $[first2, last2)$  are sorted with respect to `comp` and `proj1` or `proj2`, respectively. The resulting range does not overlap with either of the original ranges.

*Effects:* Copies the elements of the range `[first1, last1)` which are not present in the range `[first2, last2)` to the range beginning at `result`. The elements in the constructed range are sorted.

*Returns:* Let `result_last` be the end of the constructed range. Returns

- `result_last` for the overloads in namespace `std`.
- `{last1, result_last}` for the overloads in namespace `ranges`.

*Complexity:* At most  $2 * ((last1 - first1) + (last2 - first2)) - 1$  comparisons and applications of each projection.

*Remarks:* If `[first1, last1)` contains  $m$  elements that are equivalent to each other and `[first2, last2)` contains  $n$  elements that are equivalent to them, the last  $\max(m - n, 0)$  elements from `[first1, last1)` are copied to the output range, in order.

#### 27.8.7.6 `set_symmetric_difference` [`set.symmetric.difference`]

```
template<class InputIterator1, class InputIterator2,
        class OutputIterator>
constexpr OutputIterator
    set_symmetric_difference(InputIterator1 first1, InputIterator1 last1,
                            InputIterator2 first2, InputIterator2 last2,
                            OutputIterator result);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
        class ForwardIterator>
ForwardIterator
    set_symmetric_difference(ExecutionPolicy&& exec,
                            ForwardIterator1 first1, ForwardIterator1 last1,
                            ForwardIterator2 first2, ForwardIterator2 last2,
                            ForwardIterator result);

template<class InputIterator1, class InputIterator2,
        class OutputIterator, class Compare>
constexpr OutputIterator
    set_symmetric_difference(InputIterator1 first1, InputIterator1 last1,
                            InputIterator2 first2, InputIterator2 last2,
                            OutputIterator result, Compare comp);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
        class ForwardIterator, class Compare>
ForwardIterator
    set_symmetric_difference(ExecutionPolicy&& exec,
                            ForwardIterator1 first1, ForwardIterator1 last1,
                            ForwardIterator2 first2, ForwardIterator2 last2,
                            ForwardIterator result, Compare comp);

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
        weakly_incrementable O, class Comp = ranges::less,
        class Proj1 = identity, class Proj2 = identity>
requires mergeable<I1, I2, O, Comp, Proj1, Proj2>
constexpr ranges::set_symmetric_difference_result<I1, I2, O>
    ranges::set_symmetric_difference(I1 first1, S1 last1, I2 first2, S2 last2, O result,
                                    Comp comp = {}, Proj1 proj1 = {},
                                    Proj2 proj2 = {});

template<input_range R1, input_range R2, weakly_incrementable O,
        class Comp = ranges::less, class Proj1 = identity, class Proj2 = identity>
requires mergeable<iterator_t<R1>, iterator_t<R2>, O, Comp, Proj1, Proj2>
constexpr ranges::set_symmetric_difference_result<borrowed_iterator_t<R1>,
        borrowed_iterator_t<R2>, O>
    ranges::set_symmetric_difference(R1&& r1, R2&& r2, O result, Comp comp = {},
                                    Proj1 proj1 = {}, Proj2 proj2 = {});
```

Let `comp` be `less{}`, and `proj1` and `proj2` be `identity{}` for the overloads with no parameters by those names.

*Preconditions:* The ranges `[first1, last1)` and `[first2, last2)` are sorted with respect to `comp` and `proj1` or `proj2`, respectively. The resulting range does not overlap with either of the original ranges.

*Effects:* Copies the elements of the range `[first1, last1)` that are not present in the range `[first2, last2)`, and the elements of the range `[first2, last2)` that are not present in the range `[first1, last1)` to the range beginning at `result`. The elements in the constructed range are sorted.

*Returns:* Let `result_last` be the end of the constructed range. Returns

- `result_last` for the overloads in namespace `std`.
- `{last1, last2, result_last}` for the overloads in namespace `ranges`.

*Complexity:* At most  $2 * ((last1 - first1) + (last2 - first2)) - 1$  comparisons and applications of each projection.

*Remarks:* Stable (16.4.6.8). If `[first1, last1)` contains  $m$  elements that are equivalent to each other and `[first2, last2)` contains  $n$  elements that are equivalent to them, then  $|m - n|$  of those elements shall be copied to the output range: the last  $m - n$  of these elements from `[first1, last1)` if  $m > n$ , and the last  $n - m$  of these elements from `[first2, last2)` if  $m < n$ . In either case, the elements are copied in order.

## 27.8.8 Heap operations

[alg.heap.operations]

### 27.8.8.1 General

[alg.heap.operations.general]

A random access range `[a, b)` is a *heap with respect to `comp` and `proj`* for a comparator and projection `comp` and `proj` if its elements are organized such that:

- With  $N = b - a$ , for all  $i$ ,  $0 < i < N$ , `bool(invoker(comp, invoker(proj, a[ $\lfloor \frac{i-1}{2} \rfloor$ )]), invoker(proj, a[i]))` is false.
- `*a` may be removed by `pop_heap`, or a new element added by `push_heap`, in  $\mathcal{O}(\log N)$  time.

These properties make heaps useful as priority queues.

`make_heap` converts a range into a heap and `sort_heap` turns a heap into a sorted sequence.

### 27.8.8.2 push\_heap

[push.heap]

```
template<class RandomAccessIterator>
constexpr void push_heap(RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
constexpr void push_heap(RandomAccessIterator first, RandomAccessIterator last,
                          Compare comp);

template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
         class Proj = identity>
requires sortable<I, Comp, Proj>
constexpr I
    ranges::push_heap(I first, S last, Comp comp = {}, Proj proj = {});

template<random_access_range R, class Comp = ranges::less, class Proj = identity>
requires sortable<iterator_t<R>, Comp, Proj>
constexpr borrowed_iterator_t<R>
    ranges::push_heap(R&& r, Comp comp = {}, Proj proj = {});
```

Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.

*Preconditions:* The range `[first, last - 1)` is a valid heap with respect to `comp` and `proj`. For the overloads in namespace `std`, `RandomAccessIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3) and the type of `*first` meets the *Cpp17MoveConstructible* requirements (Table 31) and the *Cpp17MoveAssignable* requirements (Table 33).

*Effects:* Places the value in the location `last - 1` into the resulting heap `[first, last)`.

*Returns:* `last` for the overloads in namespace `ranges`.

*Complexity:* At most  $\log(last - first)$  comparisons and twice as many projections.

### 27.8.8.3 pop\_heap

[pop.heap]

```
template<class RandomAccessIterator>
constexpr void pop_heap(RandomAccessIterator first, RandomAccessIterator last);
```

```

template<class RandomAccessIterator, class Compare>
constexpr void pop_heap(RandomAccessIterator first, RandomAccessIterator last,
                        Compare comp);

template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
        class Proj = identity>
requires sortable<I, Comp, Proj>
constexpr I
    ranges::pop_heap(I first, S last, Comp comp = {}, Proj proj = {});
template<random_access_range R, class Comp = ranges::less, class Proj = identity>
requires sortable<iterator_t<R>, Comp, Proj>
constexpr borrowed_iterator_t<R>
    ranges::pop_heap(R&& r, Comp comp = {}, Proj proj = {});

```

Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.

*Preconditions:* The range `[first,last)` is a valid non-empty heap with respect to `comp` and `proj`. For the overloads in namespace `std`, `RandomAccessIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3) and the type of `*first` meets the *Cpp17MoveConstructible* (Table 31) and *Cpp17MoveAssignable* (Table 33) requirements.

*Effects:* Swaps the value in the location `first` with the value in the location `last - 1` and makes `[first,last - 1)` into a heap with respect to `comp` and `proj`.

*Returns:* `last` for the overloads in namespace `ranges`.

*Complexity:* At most  $2 \log(\text{last} - \text{first})$  comparisons and twice as many projections.

#### 27.8.8.4 `make_heap`

[make.heap]

```

template<class RandomAccessIterator>
constexpr void make_heap(RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
constexpr void make_heap(RandomAccessIterator first, RandomAccessIterator last,
                        Compare comp);

template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
        class Proj = identity>
requires sortable<I, Comp, Proj>
constexpr I
    ranges::make_heap(I first, S last, Comp comp = {}, Proj proj = {});
template<random_access_range R, class Comp = ranges::less, class Proj = identity>
requires sortable<iterator_t<R>, Comp, Proj>
constexpr borrowed_iterator_t<R>
    ranges::make_heap(R&& r, Comp comp = {}, Proj proj = {});

```

Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.

*Preconditions:* For the overloads in namespace `std`, `RandomAccessIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3) and the type of `*first` meets the *Cpp17MoveConstructible* (Table 31) and *Cpp17MoveAssignable* (Table 33) requirements.

*Effects:* Constructs a heap with respect to `comp` and `proj` out of the range `[first,last)`.

*Returns:* `last` for the overloads in namespace `ranges`.

*Complexity:* At most  $3(\text{last} - \text{first})$  comparisons and twice as many projections.

#### 27.8.8.5 `sort_heap`

[sort.heap]

```

template<class RandomAccessIterator>
constexpr void sort_heap(RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
constexpr void sort_heap(RandomAccessIterator first, RandomAccessIterator last,
                        Compare comp);

```

```
template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
        class Proj = identity>
requires sortable<I, Comp, Proj>
constexpr I
    ranges::sort_heap(I first, S last, Comp comp = {}, Proj proj = {});
template<random_access_range R, class Comp = ranges::less, class Proj = identity>
requires sortable<iterator_t<R>, Comp, Proj>
constexpr borrowed_iterator_t<R>
    ranges::sort_heap(R&& r, Comp comp = {}, Proj proj = {});
```

Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.

*Preconditions:* The range `[first, last)` is a valid heap with respect to `comp` and `proj`. For the overloads in namespace `std`, `RandomAccessIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3) and the type of `*first` meets the *Cpp17MoveConstructible* (Table 31) and *Cpp17MoveAssignable* (Table 33) requirements.

*Effects:* Sorts elements in the heap `[first, last)` with respect to `comp` and `proj`.

*Returns:* `last` for the overloads in namespace `ranges`.

*Complexity:* At most  $2N \log N$  comparisons, where  $N = \text{last} - \text{first}$ , and twice as many projections.

#### 27.8.8.6 `is_heap`

[is.heap]

```
template<class RandomAccessIterator>
constexpr bool is_heap(RandomAccessIterator first, RandomAccessIterator last);
```

*Effects:* Equivalent to: `return is_heap_until(first, last) == last;`

```
template<class ExecutionPolicy, class RandomAccessIterator>
bool is_heap(ExecutionPolicy&& exec,
             RandomAccessIterator first, RandomAccessIterator last);
```

*Effects:* Equivalent to:

```
return is_heap_until(std::forward<ExecutionPolicy>(exec), first, last) == last;
```

```
template<class RandomAccessIterator, class Compare>
constexpr bool is_heap(RandomAccessIterator first, RandomAccessIterator last,
                      Compare comp);
```

*Effects:* Equivalent to: `return is_heap_until(first, last, comp) == last;`

```
template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
bool is_heap(ExecutionPolicy&& exec,
             RandomAccessIterator first, RandomAccessIterator last,
             Compare comp);
```

*Effects:* Equivalent to:

```
return is_heap_until(std::forward<ExecutionPolicy>(exec), first, last, comp) == last;
```

```
template<random_access_iterator I, sentinel_for<I> S, class Proj = identity,
        indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less>
constexpr bool ranges::is_heap(I first, S last, Comp comp = {}, Proj proj = {});
template<random_access_range R, class Proj = identity,
        indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
constexpr bool ranges::is_heap(R&& r, Comp comp = {}, Proj proj = {});
```

*Effects:* Equivalent to: `return ranges::is_heap_until(first, last, comp, proj) == last;`

```
template<class RandomAccessIterator>
constexpr RandomAccessIterator
    is_heap_until(RandomAccessIterator first, RandomAccessIterator last);
template<class ExecutionPolicy, class RandomAccessIterator>
RandomAccessIterator
    is_heap_until(ExecutionPolicy&& exec,
                 RandomAccessIterator first, RandomAccessIterator last);
```

```

template<class RandomAccessIterator, class Compare>
constexpr RandomAccessIterator
    is_heap_until(RandomAccessIterator first, RandomAccessIterator last,
                  Compare comp);
template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
RandomAccessIterator
    is_heap_until(ExecutionPolicy&& exec,
                  RandomAccessIterator first, RandomAccessIterator last,
                  Compare comp);

template<random_access_iterator I, sentinel_for<I> S, class Proj = identity,
        indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less>
constexpr I ranges::is_heap_until(I first, S last, Comp comp = {}, Proj proj = {});
template<random_access_range R, class Proj = identity,
        indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
constexpr borrowed_iterator_t<R>
    ranges::is_heap_until(R&& r, Comp comp = {}, Proj proj = {});

```

Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.

*Returns:* The last iterator `i` in `[first, last]` for which the range `[first, i)` is a heap with respect to `comp` and `proj`.

*Complexity:* Linear.

## 27.8.9 Minimum and maximum

[alg.min.max]

```

template<class T>
constexpr const T& min(const T& a, const T& b);
template<class T, class Compare>
constexpr const T& min(const T& a, const T& b, Compare comp);

template<class T, class Proj = identity,
        indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less>
constexpr const T& ranges::min(const T& a, const T& b, Comp comp = {}, Proj proj = {});

```

*Preconditions:* For the first form, `T` meets the *Cpp17LessThanComparable* requirements (Table 29).

*Returns:* The smaller value. Returns the first argument when the arguments are equivalent.

*Complexity:* Exactly one comparison and two applications of the projection, if any.

*Remarks:* An invocation may explicitly specify an argument for the template parameter `T` of the overloads in namespace `std`.

```

template<class T>
constexpr T min(initializer_list<T> r);
template<class T, class Compare>
constexpr T min(initializer_list<T> r, Compare comp);

template<copyable T, class Proj = identity,
        indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less>
constexpr T ranges::min(initializer_list<T> r, Comp comp = {}, Proj proj = {});
template<input_range R, class Proj = identity,
        indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
requires indirectly_copyable_storable<iterator_t<R>, range_value_t<R>*>
constexpr range_value_t<R>
    ranges::min(R&& r, Comp comp = {}, Proj proj = {});

```

*Preconditions:* `ranges::distance(r) > 0`. For the overloads in namespace `std`, `T` meets the *Cpp17-CopyConstructible* requirements. For the first form, `T` meets the *Cpp17LessThanComparable* requirements (Table 29).

*Returns:* The smallest value in the input range. Returns a copy of the leftmost element when several elements are equivalent to the smallest.

*Complexity:* Exactly `ranges::distance(r) - 1` comparisons and twice as many applications of the projection, if any.

*Remarks:* An invocation may explicitly specify an argument for the template parameter `T` of the overloads in namespace `std`.

```
template<class T>
constexpr const T& max(const T& a, const T& b);
template<class T, class Compare>
constexpr const T& max(const T& a, const T& b, Compare comp);

template<class T, class Proj = identity,
        indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less>
constexpr const T& ranges::max(const T& a, const T& b, Comp comp = {}, Proj proj = {});
```

*Preconditions:* For the first form, `T` meets the *Cpp17LessThanComparable* requirements (Table 29).

*Returns:* The larger value. Returns the first argument when the arguments are equivalent.

*Complexity:* Exactly one comparison and two applications of the projection, if any.

*Remarks:* An invocation may explicitly specify an argument for the template parameter `T` of the overloads in namespace `std`.

```
template<class T>
constexpr T max(initializer_list<T> r);
template<class T, class Compare>
constexpr T max(initializer_list<T> r, Compare comp);

template<copyable T, class Proj = identity,
        indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less>
constexpr T ranges::max(initializer_list<T> r, Comp comp = {}, Proj proj = {});
template<input_range R, class Proj = identity,
        indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
requires indirectly_copyable_storable<iterator_t<R>, range_value_t<R>*>
constexpr range_value_t<R>
ranges::max(R&& r, Comp comp = {}, Proj proj = {});
```

*Preconditions:* `ranges::distance(r) > 0`. For the overloads in namespace `std`, `T` meets the *Cpp17-CopyConstructible* requirements. For the first form, `T` meets the *Cpp17LessThanComparable* requirements (Table 29).

*Returns:* The largest value in the input range. Returns a copy of the leftmost element when several elements are equivalent to the largest.

*Complexity:* Exactly `ranges::distance(r) - 1` comparisons and twice as many applications of the projection, if any.

*Remarks:* An invocation may explicitly specify an argument for the template parameter `T` of the overloads in namespace `std`.

```
template<class T>
constexpr pair<const T&, const T&> minmax(const T& a, const T& b);
template<class T, class Compare>
constexpr pair<const T&, const T&> minmax(const T& a, const T& b, Compare comp);

template<class T, class Proj = identity,
        indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less>
constexpr ranges::minmax_result<const T&>
ranges::minmax(const T& a, const T& b, Comp comp = {}, Proj proj = {});
```

*Preconditions:* For the first form, `T` meets the *Cpp17LessThanComparable* requirements (Table 29).

*Returns:* `{b, a}` if `b` is smaller than `a`, and `{a, b}` otherwise.

*Complexity:* Exactly one comparison and two applications of the projection, if any.

*Remarks:* An invocation may explicitly specify an argument for the template parameter `T` of the overloads in namespace `std`.

```
template<class T>
constexpr pair<T, T> minmax(initializer_list<T> t);
```

```

template<class T, class Compare>
constexpr pair<T, T> minmax(initializer_list<T> t, Compare comp);

template<copyable T, class Proj = identity,
        indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less>
constexpr ranges::minmax_result<T>
    ranges::minmax(initializer_list<T> r, Comp comp = {}, Proj proj = {});

template<input_range R, class Proj = identity,
        indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
requires indirectly_copyable_storable<iterator_t<R>, range_value_t<R>*>
constexpr ranges::minmax_result<range_value_t<R>>
    ranges::minmax(R&& r, Comp comp = {}, Proj proj = {});

```

*Preconditions:* `ranges::distance(r) > 0`. For the overloads in namespace `std`, `T` meets the *Cpp17-CopyConstructible* requirements. For the first form, type `T` meets the *Cpp17LessThanComparable* requirements (Table 29).

*Returns:* Let `X` be the return type. Returns `X{x, y}`, where `x` is a copy of the leftmost element with the smallest value and `y` a copy of the rightmost element with the largest value in the input range.

*Complexity:* At most  $(3/2)\text{ranges::distance}(r)$  applications of the corresponding predicate and twice as many applications of the projection, if any.

*Remarks:* An invocation may explicitly specify an argument for the template parameter `T` of the overloads in namespace `std`.

```

template<class ForwardIterator>
constexpr ForwardIterator min_element(ForwardIterator first, ForwardIterator last);

template<class ExecutionPolicy, class ForwardIterator>
ForwardIterator min_element(ExecutionPolicy&& exec,
                            ForwardIterator first, ForwardIterator last);

template<class ForwardIterator, class Compare>
constexpr ForwardIterator min_element(ForwardIterator first, ForwardIterator last,
                                    Compare comp);

template<class ExecutionPolicy, class ForwardIterator, class Compare>
ForwardIterator min_element(ExecutionPolicy&& exec,
                            ForwardIterator first, ForwardIterator last, Compare comp);

template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
        indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less>
constexpr I ranges::min_element(I first, S last, Comp comp = {}, Proj proj = {});

template<forward_range R, class Proj = identity,
        indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
constexpr borrowed_iterator_t<R>
    ranges::min_element(R&& r, Comp comp = {}, Proj proj = {});

```

Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.

*Returns:* The first iterator `i` in the range `[first,last)` such that for every iterator `j` in the range `[first,last)`,

`bool(invoker(comp, invoker(proj, *j), invoker(proj, *i)))`

is false. Returns `last` if `first == last`.

*Complexity:* Exactly  $\max(\text{last} - \text{first} - 1, 0)$  comparisons and twice as many projections.

```

template<class ForwardIterator>
constexpr ForwardIterator max_element(ForwardIterator first, ForwardIterator last);

template<class ExecutionPolicy, class ForwardIterator>
ForwardIterator max_element(ExecutionPolicy&& exec,
                            ForwardIterator first, ForwardIterator last);

template<class ForwardIterator, class Compare>
constexpr ForwardIterator max_element(ForwardIterator first, ForwardIterator last,
                                    Compare comp);

```

```

template<class ExecutionPolicy, class ForwardIterator, class Compare>
    ForwardIterator max_element(ExecutionPolicy&& exec,
                               ForwardIterator first, ForwardIterator last,
                               Compare comp);

template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
        indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less>
    constexpr I ranges::max_element(I first, S last, Comp comp = {}, Proj proj = {});
template<forward_range R, class Proj = identity,
        indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
    constexpr borrowed_iterator_t<R>
    ranges::max_element(R&& r, Comp comp = {}, Proj proj = {});

```

Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.

*Returns:* The first iterator `i` in the range `[first,last)` such that for every iterator `j` in the range `[first,last)`,

`bool(invoker(comp, invoker(proj, *i), invoker(proj, *j)))`

is false. Returns `last` if `first == last`.

*Complexity:* Exactly  $\max(\text{last} - \text{first} - 1, 0)$  comparisons and twice as many projections.

```

template<class ForwardIterator>
    constexpr pair<ForwardIterator, ForwardIterator>
    minmax_element(ForwardIterator first, ForwardIterator last);
template<class ExecutionPolicy, class ForwardIterator>
    pair<ForwardIterator, ForwardIterator>
    minmax_element(ExecutionPolicy&& exec,
                   ForwardIterator first, ForwardIterator last);

template<class ForwardIterator, class Compare>
    constexpr pair<ForwardIterator, ForwardIterator>
    minmax_element(ForwardIterator first, ForwardIterator last, Compare comp);
template<class ExecutionPolicy, class ForwardIterator, class Compare>
    pair<ForwardIterator, ForwardIterator>
    minmax_element(ExecutionPolicy&& exec,
                   ForwardIterator first, ForwardIterator last, Compare comp);

template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
        indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less>
    constexpr ranges::minmax_element_result<I>
    ranges::minmax_element(I first, S last, Comp comp = {}, Proj proj = {});
template<forward_range R, class Proj = identity,
        indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
    constexpr ranges::minmax_element_result<borrowed_iterator_t<R>>
    ranges::minmax_element(R&& r, Comp comp = {}, Proj proj = {});

```

*Returns:* `{first, first}` if `[first,last)` is empty, otherwise `{m, M}`, where `m` is the first iterator in `[first,last)` such that no iterator in the range refers to a smaller element, and where `M` is the last iterator<sup>218</sup> in `[first,last)` such that no iterator in the range refers to a larger element.

*Complexity:* Let  $N$  be `last - first`. At most  $\max(\lfloor \frac{3}{2}(N-1) \rfloor, 0)$  comparisons and twice as many applications of the projection, if any.

### 27.8.10 Bounded value

[alg.clamp]

```

template<class T>
    constexpr const T& clamp(const T& v, const T& lo, const T& hi);
template<class T, class Compare>
    constexpr const T& clamp(const T& v, const T& lo, const T& hi, Compare comp);

```

<sup>218</sup>) This behavior intentionally differs from `max_element`.

```
template<class T, class Proj = identity,
        indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less>
constexpr const T&
ranges::clamp(const T& v, const T& lo, const T& hi, Comp comp = {}, Proj proj = {});
```

Let `comp` be `less{}` for the overloads with no parameter `comp`, and let `proj` be `identity{}` for the overloads with no parameter `proj`.

*Preconditions:* `bool(invoker(comp, invoker(proj, hi), invoker(proj, lo)))` is false. For the first form, type `T` meets the *Cpp17LessThanComparable* requirements (Table 29).

*Returns:* `lo` if `bool(invoker(comp, invoker(proj, v), invoker(proj, lo)))` is true, `hi` if `bool(invoker(comp, invoker(proj, hi), invoker(proj, v)))` is true, otherwise `v`.

NOTE If NaN is avoided, `T` can be a floating-point type.

*Complexity:* At most two comparisons and three applications of the projection.

## 27.8.11 Lexicographical comparison

[alg.lex.comparison]

```
template<class InputIterator1, class InputIterator2>
constexpr bool
lexicographical_compare(InputIterator1 first1, InputIterator1 last1,
                        InputIterator2 first2, InputIterator2 last2);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
bool
lexicographical_compare(ExecutionPolicy&& exec,
                        ForwardIterator1 first1, ForwardIterator1 last1,
                        ForwardIterator2 first2, ForwardIterator2 last2);

template<class InputIterator1, class InputIterator2, class Compare>
constexpr bool
lexicographical_compare(InputIterator1 first1, InputIterator1 last1,
                        InputIterator2 first2, InputIterator2 last2,
                        Compare comp);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
        class Compare>
bool
lexicographical_compare(ExecutionPolicy&& exec,
                        ForwardIterator1 first1, ForwardIterator1 last1,
                        ForwardIterator2 first2, ForwardIterator2 last2,
                        Compare comp);

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
        class Proj1 = identity, class Proj2 = identity,
        indirect_strict_weak_order<projected<I1, Proj1>,
        projected<I2, Proj2>> Comp = ranges::less>
constexpr bool
ranges::lexicographical_compare(I1 first1, S1 last1, I2 first2, S2 last2,
                                Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});

template<input_range R1, input_range R2, class Proj1 = identity,
        class Proj2 = identity,
        indirect_strict_weak_order<projected<iterator_t<R1>, Proj1>,
        projected<iterator_t<R2>, Proj2>> Comp = ranges::less>
constexpr bool
ranges::lexicographical_compare(R1&& r1, R2&& r2, Comp comp = {},
                                Proj1 proj1 = {}, Proj2 proj2 = {});
```

*Returns:* true if and only if the sequence of elements defined by the range `[first1, last1)` is lexicographically less than the sequence of elements defined by the range `[first2, last2)`.

*Complexity:* At most  $2 \min(\text{last1} - \text{first1}, \text{last2} - \text{first2})$  applications of the corresponding comparison and each projection, if any.

*Remarks:* If two sequences have the same number of elements and their corresponding elements (if any) are equivalent, then neither sequence is lexicographically less than the other. If one sequence is a proper prefix of the other, then the shorter sequence is lexicographically less than the longer sequence.

Otherwise, the lexicographical comparison of the sequences yields the same result as the comparison of the first corresponding pair of elements that are not equivalent.

EXAMPLE `ranges::lexicographical_compare(I1, S1, I2, S2, Comp, Proj1, Proj2)` can be implemented as:

```
for ( ; first1 != last1 && first2 != last2 ; ++first1, (void) ++first2) {
    if (invoke(comp, invoke(proj1, *first1), invoke(proj2, *first2))) return true;
    if (invoke(comp, invoke(proj2, *first2), invoke(proj1, *first1))) return false;
}
return first1 == last1 && first2 != last2;
```

NOTE An empty sequence is lexicographically less than any non-empty sequence, but not less than any empty sequence.

### 27.8.12 Three-way comparison algorithms

[alg.three.way]

```
template<class InputIterator1, class InputIterator2, class Cmp>
```

```
constexpr auto
```

```
lexicographical_compare_three_way(InputIterator1 b1, InputIterator1 e1,
                                  InputIterator2 b2, InputIterator2 e2,
                                  Cmp comp)
```

```
-> decltype(comp(*b1, *b2));
```

Let  $N$  be  $\min(e1 - b1, e2 - b2)$ . Let  $E(n)$  be  $\text{comp}(*(b1 + n), *(b2 + n))$ .

*Mandates:*  $\text{decltype}(\text{comp}(*b1, *b2))$  is a comparison category type.

*Returns:*  $E(i)$ , where  $i$  is the smallest integer in  $[0, N)$  such that  $E(i) \neq 0$  is true, or  $(e1 - b1) <= (e2 - b2)$  if no such integer exists.

*Complexity:* At most  $N$  applications of `comp`.

```
template<class InputIterator1, class InputIterator2>
```

```
constexpr auto
```

```
lexicographical_compare_three_way(InputIterator1 b1, InputIterator1 e1,
                                  InputIterator2 b2, InputIterator2 e2);
```

*Effects:* Equivalent to:

```
return lexicographical_compare_three_way(b1, e1, b2, e2, compare_three_way());
```

### 27.8.13 Permutation generators

[alg.permutation.generators]

```
template<class BidirectionalIterator>
```

```
constexpr bool next_permutation(BidirectionalIterator first,
                                BidirectionalIterator last);
```

```
template<class BidirectionalIterator, class Compare>
```

```
constexpr bool next_permutation(BidirectionalIterator first,
                                BidirectionalIterator last, Compare comp);
```

```
template<bidirectional_iterator I, sentinel_for<I> S, class Comp = ranges::less,
        class Proj = identity>
```

```
requires sortable<I, Comp, Proj>
```

```
constexpr ranges::next_permutation_result<I>
```

```
ranges::next_permutation(I first, S last, Comp comp = {}, Proj proj = {});
```

```
template<bidirectional_range R, class Comp = ranges::less,
```

```
        class Proj = identity>
```

```
requires sortable<iterator_t<R>, Comp, Proj>
```

```
constexpr ranges::next_permutation_result<borrowed_iterator_t<R>>
```

```
ranges::next_permutation(R&& r, Comp comp = {}, Proj proj = {});
```

Let `comp` be `less{}` and `proj` be `identity{}` for overloads with no parameters by those names.

*Preconditions:* For the overloads in namespace `std`, `BidirectionalIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3).

*Effects:* Takes a sequence defined by the range `[first, last)` and transforms it into the next permutation. The next permutation is found by assuming that the set of all permutations is lexicographically sorted

with respect to `comp` and `proj`. If no such permutation exists, transforms the sequence into the first permutation; that is, the ascendingly-sorted one.

*Returns:* Let `B` be `true` if a next permutation was found and otherwise `false`. Returns:

- `B` for the overloads in namespace `std`.
- `{ last, B }` for the overloads in namespace `ranges`.

*Complexity:* At most  $(\text{last} - \text{first}) / 2$  swaps.

```
template<class BidirectionalIterator>
constexpr bool prev_permutation(BidirectionalIterator first,
                                BidirectionalIterator last);

template<class BidirectionalIterator, class Compare>
constexpr bool prev_permutation(BidirectionalIterator first,
                                BidirectionalIterator last, Compare comp);

template<bidirectional_iterator I, sentinel_for<I> S, class Comp = ranges::less,
        class Proj = identity>
requires sortable<I, Comp, Proj>
constexpr ranges::prev_permutation_result<I>
    ranges::prev_permutation(I first, S last, Comp comp = {}, Proj proj = {});
template<bidirectional_range R, class Comp = ranges::less,
        class Proj = identity>
requires sortable<iterator_t<R>, Comp, Proj>
constexpr ranges::prev_permutation_result<borrowed_iterator_t<R>>
    ranges::prev_permutation(R&& r, Comp comp = {}, Proj proj = {});
```

Let `comp` be `less{}` and `proj` be `identity{}` for overloads with no parameters by those names.

*Preconditions:* For the overloads in namespace `std`, `BidirectionalIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3).

*Effects:* Takes a sequence defined by the range `[first, last)` and transforms it into the previous permutation. The previous permutation is found by assuming that the set of all permutations is lexicographically sorted with respect to `comp` and `proj`. If no such permutation exists, transforms the sequence into the last permutation; that is, the descendingly-sorted one.

*Returns:* Let `B` be `true` if a previous permutation was found and otherwise `false`. Returns:

- `B` for the overloads in namespace `std`.
- `{ last, B }` for the overloads in namespace `ranges`.

*Complexity:* At most  $(\text{last} - \text{first}) / 2$  swaps.

## 27.9 Header `<numeric>` synopsis

[numeric.ops.overview]

```
namespace std {
    // 27.10.3, accumulate
    template<class InputIterator, class T>
    constexpr T accumulate(InputIterator first, InputIterator last, T init);
    template<class InputIterator, class T, class BinaryOperation>
    constexpr T accumulate(InputIterator first, InputIterator last, T init,
                            BinaryOperation binary_op);

    // 27.10.4, reduce
    template<class InputIterator>
    constexpr typename iterator_traits<InputIterator>::value_type

template<class T>
constexpr T* midpoint(T* a, T* b);
}

```

## 27.10 Generalized numeric operations [numeric.ops]

### 27.10.1 General [numeric.ops.general]

NOTE The use of closed ranges as well as semi-open ranges to specify requirements throughout 27.10 is intentional.

### 27.10.2 Definitions [numeric.defns]

Define *GENERALIZED\_NONCOMMUTATIVE\_SUM*(op, a1, ..., aN) as follows:

- a1 when N is 1, otherwise
- op(*GENERALIZED\_NONCOMMUTATIVE\_SUM*(op, a1, ..., aK),  
*GENERALIZED\_NONCOMMUTATIVE\_SUM*(op, aM, ..., aN)) for any K where  $1 < K + 1 = M \leq N$ .

Define *GENERALIZED\_SUM*(op, a1, ..., aN) as *GENERALIZED\_NONCOMMUTATIVE\_SUM*(op, b1, ..., bN), where b1, ..., bN may be any permutation of a1, ..., aN.

### 27.10.3 Accumulate [accumulate]

```

template<class InputIterator, class T>
constexpr T accumulate(InputIterator first, InputIterator last, T init);
template<class InputIterator, class T, class BinaryOperation>
constexpr T accumulate(InputIterator first, InputIterator last, T init,
    BinaryOperation binary_op);

```

*Preconditions:* T meets the *Cpp17CopyConstructible* (Table 32) and *Cpp17CopyAssignable* (Table 34) requirements. In the range [first, last], binary\_op neither modifies elements nor invalidates iterators or subranges.<sup>219</sup>

*Effects:* Computes its result by initializing the accumulator acc with the initial value init and then modifies it with acc = std::move(acc) + \*i or acc = binary\_op(std::move(acc), \*i) for every iterator i in the range [first, last) in order.<sup>220</sup>

### 27.10.4 Reduce [reduce]

```

template<class InputIterator>
constexpr typename iterator_traits<InputIterator>::value_type
    reduce(InputIterator first, InputIterator last);

Effects: Equivalent to:

    return reduce(first, last,
        typename iterator_traits<InputIterator>::value_type{});

```

<sup>219</sup>) The use of fully closed ranges is intentional.

<sup>220</sup>) *accumulate* is similar to the APL reduction operator and Common Lisp reduce function, but it avoids the difficulty of defining the result of reduction on an empty sequence by always requiring an initial value.

```
template<class ExecutionPolicy, class ForwardIterator>
typename iterator_traits<ForwardIterator>::value_type
reduce(ExecutionPolicy&& exec,
       ForwardIterator first, ForwardIterator last);
```

*Effects:* Equivalent to:

```
return reduce(std::forward<ExecutionPolicy>(exec), first, last,
              typename iterator_traits<ForwardIterator>::value_type{});
```

```
template<class InputIterator, class T>
constexpr T reduce(InputIterator first, InputIterator last, T init);
```

*Effects:* Equivalent to:

```
return reduce(first, last, init, plus<>());
```

```
template<class ExecutionPolicy, class ForwardIterator, class T>
T reduce(ExecutionPolicy&& exec,
        ForwardIterator first, ForwardIterator last, T init);
```

*Effects:* Equivalent to:

```
return reduce(std::forward<ExecutionPolicy>(exec), first, last, init, plus<>());
```

```
template<class InputIterator, class T, class BinaryOperation>
constexpr T reduce(InputIterator first, InputIterator last, T init,
                  BinaryOperation binary_op);
template<class ExecutionPolicy, class ForwardIterator, class T, class BinaryOperation>
T reduce(ExecutionPolicy&& exec,
        ForwardIterator first, ForwardIterator last, T init,
        BinaryOperation binary_op);
```

*Mandates:* All of

- `binary_op`(init, \*first),
- `binary_op`(\*first, init),
- `binary_op`(init, init), and
- `binary_op`(\*first, \*first)

are convertible to T.

*Preconditions:*

- T meets the *Cpp17MoveConstructible* (Table 31) requirements.
- `binary_op` neither invalidates iterators or subranges, nor modifies elements in the range [first, last].

*Returns:* *GENERALIZED\_SUM*(`binary_op`, init, \*i, ...) for every i in [first, last).

*Complexity:*  $O(\text{last} - \text{first})$  applications of `binary_op`.

NOTE The difference between `reduce` and `accumulate` is that `reduce` applies `binary_op` in an unspecified order, which yields a nondeterministic result for non-associative or non-commutative `binary_op` such as floating-point addition.

### 27.10.5 Inner product

[inner.product]

```
template<class InputIterator1, class InputIterator2, class T>
constexpr T inner_product(InputIterator1 first1, InputIterator1 last1,
                          InputIterator2 first2, T init);
template<class InputIterator1, class InputIterator2, class T,
        class BinaryOperation1, class BinaryOperation2>
constexpr T inner_product(InputIterator1 first1, InputIterator1 last1,
                          InputIterator2 first2, T init,
                          BinaryOperation1 binary_op1,
                          BinaryOperation2 binary_op2);
```

*Preconditions:* T meets the *Cpp17CopyConstructible* (Table 32) and *Cpp17CopyAssignable* (Table 34) requirements. In the ranges [first1, last1] and [first2, first2 + (last1 - first1)] `binary_op1`

and `binary_op2` neither modifies elements nor invalidates iterators or subranges.<sup>221</sup>

*Effects:* Computes its result by initializing the accumulator `acc` with the initial value `init` and then modifying it with `acc = std::move(acc) + (*i1) * (*i2)` or `acc = binary_op1(std::move(acc), binary_op2(*i1, *i2))` for every iterator `i1` in the range `[first1, last1)` and iterator `i2` in the range `[first2, first2 + (last1 - first1))` in order.

### 27.10.6 Transform reduce

[transform.reduce]

```
template<class InputIterator1, class InputIterator2, class T>
constexpr T transform_reduce(InputIterator1 first1, InputIterator1 last1,
                             InputIterator2 first2,
                             T init);
```

*Effects:* Equivalent to:

```
return transform_reduce(first1, last1, first2, init, plus<>(), multiplies<>());
```

```
template<class ExecutionPolicy,
         class ForwardIterator1, class ForwardIterator2, class T>
T transform_reduce(ExecutionPolicy&& exec,
                  ForwardIterator1 first1, ForwardIterator1 last1,
                  ForwardIterator2 first2,
                  T init);
```

*Effects:* Equivalent to:

```
return transform_reduce(std::forward<ExecutionPolicy>(exec),
                        first1, last1, first2, init, plus<>(), multiplies<>());
```

```
template<class InputIterator1, class InputIterator2, class T,
         class BinaryOperation1, class BinaryOperation2>
constexpr T transform_reduce(InputIterator1 first1, InputIterator1 last1,
                             InputIterator2 first2,
                             T init,
                             BinaryOperation1 binary_op1,
                             BinaryOperation2 binary_op2);
```

```
template<class ExecutionPolicy,
         class ForwardIterator1, class ForwardIterator2, class T,
         class BinaryOperation1, class BinaryOperation2>
T transform_reduce(ExecutionPolicy&& exec,
                  ForwardIterator1 first1, ForwardIterator1 last1,
                  ForwardIterator2 first2,
                  T init,
                  BinaryOperation1 binary_op1,
                  BinaryOperation2 binary_op2);
```

*Mandates:* All of

- `binary_op1`(`init`, `init`),
- `binary_op1`(`init`, `binary_op2(*first1, *first2)`),
- `binary_op1`(`binary_op2(*first1, *first2)`, `init`), and
- `binary_op1`(`binary_op2(*first1, *first2)`, `binary_op2(*first1, *first2)`)

are convertible to `T`.

*Preconditions:*

- `T` meets the *Cpp17MoveConstructible* (Table 31) requirements.
- Neither `binary_op1` nor `binary_op2` invalidates subranges, nor modifies elements in the ranges `[first1, last1]` and `[first2, first2 + (last1 - first1)]`.

*Returns:*

```
GENERALIZED_SUM(binary_op1, init, binary_op2(*i, *(first2 + (i - first1))), ...)
```

for every iterator `i` in `[first1, last1)`.

<sup>221</sup>) The use of fully closed ranges is intentional.

*Complexity:*  $\mathcal{O}(\text{last1} - \text{first1})$  applications each of `binary_op1` and `binary_op2`.

```
template<class InputIterator, class T,
        class BinaryOperation, class UnaryOperation>
constexpr T transform_reduce(InputIterator first, InputIterator last, T init,
                            BinaryOperation binary_op, UnaryOperation unary_op);

template<class ExecutionPolicy,
        class ForwardIterator, class T,
        class BinaryOperation, class UnaryOperation>
T transform_reduce(ExecutionPolicy&& exec,
                  ForwardIterator first, ForwardIterator last,
                  T init, BinaryOperation binary_op, UnaryOperation unary_op);
```

*Mandates:* All of

- `binary_op(init, init)`,
- `binary_op(init, unary_op(*first))`,
- `binary_op(unary_op(*first), init)`, and
- `binary_op(unary_op(*first), unary_op(*first))`

are convertible to `T`.

*Preconditions:*

- `T` meets the *Cpp17MoveConstructible* (Table 31) requirements.
- Neither `unary_op` nor `binary_op` invalidates subranges, nor modifies elements in the range `[first, last]`.

*Returns:*

`GENERALIZED_SUM(binary_op, init, unary_op(*i), ...)`

for every iterator `i` in `[first, last)`.

*Complexity:*  $\mathcal{O}(\text{last} - \text{first})$  applications each of `unary_op` and `binary_op`.

NOTE `transform_reduce` does not apply `unary_op` to `init`.

## 27.10.7 Partial sum

[partial.sum]

```
template<class InputIterator, class OutputIterator>
constexpr OutputIterator
partial_sum(InputIterator first, InputIterator last,
            OutputIterator result);

template<class InputIterator, class OutputIterator, class BinaryOperation>
constexpr OutputIterator
partial_sum(InputIterator first, InputIterator last,
            OutputIterator result, BinaryOperation binary_op);
```

*Mandates:* `InputIterator`'s value type is constructible from `*first`. The result of the expression `std::move(acc) + *i` or `binary_op(std::move(acc), *i)` is implicitly convertible to `InputIterator`'s value type. `acc` is writable (25.3.1) to `result`.

*Preconditions:* In the ranges `[first, last]` and `[result, result + (last - first)]` `binary_op` neither modifies elements nor invalidates iterators or subranges. <sup>222</sup>

*Effects:* For a non-empty range, the function creates an accumulator `acc` whose type is `InputIterator`'s value type, initializes it with `*first`, and assigns the result to `*result`. For every iterator `i` in `[first + 1, last)` in order, `acc` is then modified by `acc = std::move(acc) + *i` or `acc = binary_op(std::move(acc), *i)` and the result is assigned to `*(result + (i - first))`.

*Returns:* `result + (last - first)`.

*Complexity:* Exactly  $(\text{last} - \text{first}) - 1$  applications of the binary operation.

*Remarks:* `result` may be equal to `first`.

<sup>222</sup>) The use of fully closed ranges is intentional.

## 27.10.8 Exclusive scan

[exclusive.scan]

```
template<class InputIterator, class OutputIterator, class T>
constexpr OutputIterator
exclusive_scan(InputIterator first, InputIterator last,
               OutputIterator result, T init);
```

*Effects:* Equivalent to:

```
return exclusive_scan(first, last, result, init, plus<>());
```

```
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, class T>
ForwardIterator2
exclusive_scan(ExecutionPolicy&& exec,
               ForwardIterator1 first, ForwardIterator1 last,
               ForwardIterator2 result, T init);
```

*Effects:* Equivalent to:

```
return exclusive_scan(std::forward<ExecutionPolicy>(exec),
                     first, last, result, init, plus<>());
```

```
template<class InputIterator, class OutputIterator, class T, class BinaryOperation>
constexpr OutputIterator
exclusive_scan(InputIterator first, InputIterator last,
               OutputIterator result, T init, BinaryOperation binary_op);
template<class ExecutionPolicy,
         class ForwardIterator1, class ForwardIterator2, class T, class BinaryOperation>
ForwardIterator2
exclusive_scan(ExecutionPolicy&& exec,
               ForwardIterator1 first, ForwardIterator1 last,
               ForwardIterator2 result, T init, BinaryOperation binary_op);
```

*Mandates:* All of

- `binary_op`(init, init),
- `binary_op`(init, \*first), and
- `binary_op`(\*first, \*first)

are convertible to T.

*Preconditions:*

- T meets the *Cpp17MoveConstructible* (Table 31) requirements.
- `binary_op` neither invalidates iterators or subranges, nor modifies elements in the ranges [first, last] or [result, result + (last - first)].

*Effects:* For each integer K in [0, last - first) assigns through `result + K` the value of:

```
GENERALIZED_NONCOMMUTATIVE_SUM(
    binary_op, init, *(first + 0), *(first + 1), ..., *(first + K - 1))
```

*Returns:* The end of the resulting range beginning at `result`.

*Complexity:*  $\mathcal{O}(\text{last} - \text{first})$  applications of `binary_op`.

*Remarks:* `result` may be equal to `first`.

NOTE The difference between `exclusive_scan` and `inclusive_scan` is that `exclusive_scan` excludes the  $i^{\text{th}}$  input element from the  $i^{\text{th}}$  sum. If `binary_op` is not mathematically associative, the behavior of `exclusive_scan` can be nondeterministic.

## 27.10.9 Inclusive scan

[inclusive.scan]

```
template<class InputIterator, class OutputIterator>
constexpr OutputIterator
inclusive_scan(InputIterator first, InputIterator last,
               OutputIterator result);
```

*Effects:* Equivalent to:

```
return inclusive_scan(first, last, result, plus<>());
```

```

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
ForwardIterator2
    inclusive_scan(ExecutionPolicy&& exec,
                  ForwardIterator1 first, ForwardIterator1 last,
                  ForwardIterator2 result);

Effects: Equivalent to:

    return inclusive_scan(std::forward<ExecutionPolicy>(exec), first, last, result, plus<>());

template<class InputIterator, class OutputIterator, class BinaryOperation>
constexpr OutputIterator
    inclusive_scan(InputIterator first, InputIterator last,
                  OutputIterator result, BinaryOperation binary_op);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
        class BinaryOperation>
ForwardIterator2
    inclusive_scan(ExecutionPolicy&& exec,
                  ForwardIterator1 first, ForwardIterator1 last,
                  ForwardIterator2 result, BinaryOperation binary_op);

template<class InputIterator, class OutputIterator, class BinaryOperation, class T>
constexpr OutputIterator
    inclusive_scan(InputIterator first, InputIterator last,
                  OutputIterator result, BinaryOperation binary_op, T init);
template<class ExecutionPolicy,
        class ForwardIterator1, class ForwardIterator2, class BinaryOperation, class T>
ForwardIterator2
    inclusive_scan(ExecutionPolicy&& exec,
                  ForwardIterator1 first, ForwardIterator1 last,
                  ForwardIterator2 result, BinaryOperation binary_op, T init);

```

Let  $U$  be the value type of `decltype(first)`.

*Mandates:* If `init` is provided, all of

- `binary_op(init, init)`,
- `binary_op(init, *first)`, and
- `binary_op(*first, *first)`

are convertible to  $T$ ; otherwise, `binary_op(*first, *first)` is convertible to  $U$ .

*Preconditions:*

- If `init` is provided,  $T$  meets the *Cpp17MoveConstructible* (Table 31) requirements; otherwise,  $U$  meets the *Cpp17MoveConstructible* requirements.
- `binary_op` neither invalidates iterators or subranges, nor modifies elements in the ranges `[first, last]` or `[result, result + (last - first)]`.

*Effects:* For each integer  $K$  in  $[0, \text{last} - \text{first})$  assigns through `result + K` the value of

- `GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, *(first + 0), *(first + 1), ..., *(first + K))` if `init` is provided, or
- `GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, *(first + 0), *(first + 1), ..., *(first + K))` otherwise.

*Returns:* The end of the resulting range beginning at `result`.

*Complexity:*  $\mathcal{O}(\text{last} - \text{first})$  applications of `binary_op`.

*Remarks:* `result` may be equal to `first`.

NOTE The difference between `exclusive_scan` and `inclusive_scan` is that `inclusive_scan` includes the  $i^{\text{th}}$  input element in the  $i^{\text{th}}$  sum. If `binary_op` is not mathematically associative, the behavior of `inclusive_scan` can be nondeterministic.

**27.10.10 Transform exclusive scan****[transform.exclusive.scan]**

```
template<class InputIterator, class OutputIterator, class T,
        class BinaryOperation, class UnaryOperation>
constexpr OutputIterator
    transform_exclusive_scan(InputIterator first, InputIterator last,
                           OutputIterator result, T init,
                           BinaryOperation binary_op, UnaryOperation unary_op);

template<class ExecutionPolicy,
        class ForwardIterator1, class ForwardIterator2, class T,
        class BinaryOperation, class UnaryOperation>
ForwardIterator2
    transform_exclusive_scan(ExecutionPolicy&& exec,
                           ForwardIterator1 first, ForwardIterator1 last,
                           ForwardIterator2 result, T init,
                           BinaryOperation binary_op, UnaryOperation unary_op);
```

*Mandates:* All of

- `binary_op`(`init`, `init`),
- `binary_op`(`init`, `unary_op`(`*first`)), and
- `binary_op`(`unary_op`(`*first`), `unary_op`(`*first`))

are convertible to `T`.

*Preconditions:*

- `T` meets the *Cpp17MoveConstructible* (Table 31) requirements.
- Neither `unary_op` nor `binary_op` invalidates iterators or subranges, nor modifies elements in the ranges `[first, last]` or `[result, result + (last - first)]`.

*Effects:* For each integer `K` in `[0, last - first)` assigns through `result + K` the value of:

```
GENERALIZED_NONCOMMUTATIVE_SUM(
    binary_op, init,
    unary_op(*first), unary_op(*first + 1), ..., unary_op(*first + K - 1))
```

*Returns:* The end of the resulting range beginning at `result`.

*Complexity:*  $\mathcal{O}(\text{last} - \text{first})$  applications each of `unary_op` and `binary_op`.

*Remarks:* `result` may be equal to `first`.

NOTE The difference between `transform_exclusive_scan` and `transform_inclusive_scan` is that `transform_exclusive_scan` excludes the  $i^{\text{th}}$  input element from the  $i^{\text{th}}$  sum. If `binary_op` is not mathematically associative, the behavior of `transform_exclusive_scan` can be nondeterministic. `transform_exclusive_scan` does not apply `unary_op` to `init`.

**27.10.11 Transform inclusive scan****[transform.inclusive.scan]**

```
template<class InputIterator, class OutputIterator,
        class BinaryOperation, class UnaryOperation>
constexpr OutputIterator
    transform_inclusive_scan(InputIterator first, InputIterator last,
                           OutputIterator result,
                           BinaryOperation binary_op, UnaryOperation unary_op);

template<class ExecutionPolicy,
        class ForwardIterator1, class ForwardIterator2,
        class BinaryOperation, class UnaryOperation>
ForwardIterator2
    transform_inclusive_scan(ExecutionPolicy&& exec,
                           ForwardIterator1 first, ForwardIterator1 last,
                           ForwardIterator2 result,
                           BinaryOperation binary_op, UnaryOperation unary_op);

template<class InputIterator, class OutputIterator,
        class BinaryOperation, class UnaryOperation, class T>
constexpr OutputIterator
    transform_inclusive_scan(InputIterator first, InputIterator last,
                           OutputIterator result,
```

```

        BinaryOperation binary_op, UnaryOperation unary_op,
        T init);
template<class ExecutionPolicy,
        class ForwardIterator1, class ForwardIterator2,
        class BinaryOperation, class UnaryOperation, class T>
ForwardIterator2
transform_inclusive_scan(ExecutionPolicy&& exec,
                        ForwardIterator1 first, ForwardIterator1 last,
                        ForwardIterator2 result,
                        BinaryOperation binary_op, UnaryOperation unary_op,
                        T init);

```

Let U be the value type of `decltype(first)`.

*Mandates:* If `init` is provided, all of

- `binary_op(init, init)`,
- `binary_op(init, unary_op(*first))`, and
- `binary_op(unary_op(*first), unary_op(*first))`

are convertible to T; otherwise, `binary_op(unary_op(*first), unary_op(*first))` is convertible to U.

*Preconditions:*

- If `init` is provided, T meets the *Cpp17MoveConstructible* (Table 31) requirements; otherwise, U meets the *Cpp17MoveConstructible* requirements.
- Neither `unary_op` nor `binary_op` invalidates iterators or subranges, nor modifies elements in the ranges `[first, last]` or `[result, result + (last - first)]`.

*Effects:* For each integer K in `[0, last - first)` assigns through `result + K` the value of

- `GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, unary_op(*(first + 0)), unary_op(*(first + 1)), ..., unary_op(*(first + K)))` if `init` is provided, or
- `GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, unary_op(*(first + 0)), unary_op(*(first + 1)), ..., unary_op(*(first + K)))` otherwise.

*Returns:* The end of the resulting range beginning at `result`.

*Complexity:*  $\mathcal{O}(\text{last} - \text{first})$  applications each of `unary_op` and `binary_op`.

*Remarks:* `result` may be equal to `first`.

NOTE The difference between `transform_exclusive_scan` and `transform_inclusive_scan` is that `transform_inclusive_scan` includes the  $i^{\text{th}}$  input element in the  $i^{\text{th}}$  sum. If `binary_op` is not mathematically associative, the behavior of `transform_inclusive_scan` can be nondeterministic. `transform_inclusive_scan` does not apply `unary_op` to `init`.

## 27.10.12 Adjacent difference

[adjacent.difference]

```

template<class InputIterator, class OutputIterator>
constexpr OutputIterator
adjacent_difference(InputIterator first, InputIterator last,
                    OutputIterator result);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
ForwardIterator2
adjacent_difference(ExecutionPolicy&& exec,
                    ForwardIterator1 first, ForwardIterator1 last, ForwardIterator2 result);

template<class InputIterator, class OutputIterator, class BinaryOperation>
constexpr OutputIterator
adjacent_difference(InputIterator first, InputIterator last,
                    OutputIterator result, BinaryOperation binary_op);

```

```
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
        class BinaryOperation>
ForwardIterator2
adjacent_difference(ExecutionPolicy&& exec,
                    ForwardIterator1 first, ForwardIterator1 last,
                    ForwardIterator2 result, BinaryOperation binary_op);
```

Let *T* be the value type of `decltype(first)`. For the overloads that do not take an argument `binary_op`, let `binary_op` be an lvalue that denotes an object of type `minus<>`.

*Mandates:*

- For the overloads with no `ExecutionPolicy`, *T* is constructible from `*first`. `acc` (defined below) is writable (25.3.1) to the `result` output iterator. The result of the expression `binary_op(val, std::move(acc))` is writable to `result`.
- For the overloads with an `ExecutionPolicy`, the result of the expressions `binary_op(*first, *first)` and `*first` are writable to `result`.

*Preconditions:*

- For the overloads with no `ExecutionPolicy`, *T* meets the *Cpp17MoveAssignable* (Table 33) requirements.
- For all overloads, in the ranges `[first, last]` and `[result, result + (last - first)]`, `binary_op` neither modifies elements nor invalidates iterators or subranges.<sup>223</sup>

*Effects:* For the overloads with no `ExecutionPolicy` and a non-empty range, the function creates an accumulator `acc` of type *T*, initializes it with `*first`, and assigns the result to `*result`. For every iterator *i* in `[first + 1, last)` in order, creates an object `val` whose type is *T*, initializes it with `*i`, computes `binary_op(val, std::move(acc))`, assigns the result to `*(result + (i - first))`, and move assigns from `val` to `acc`.

For the overloads with an `ExecutionPolicy` and a non-empty range, performs `*result = *first`. Then, for every *d* in `[1, last - first - 1]`, performs `*(result + d) = binary_op(*(first + d), *(first + (d - 1)))`.

*Returns:* `result + (last - first)`.

*Complexity:* Exactly `(last - first) - 1` applications of the binary operation.

*Remarks:* For the overloads with no `ExecutionPolicy`, `result` may be equal to `first`. For the overloads with an `ExecutionPolicy`, the ranges `[first, last)` and `[result, result + (last - first))` shall not overlap.

### 27.10.13 Iota

[numeric.iota]

```
template<class ForwardIterator, class T>
constexpr void iota(ForwardIterator first, ForwardIterator last, T value);
```

*Mandates:* *T* is convertible to `ForwardIterator`'s value type. The expression `++val`, where `val` has type *T*, is well-formed.

*Effects:* For each element referred to by the iterator *i* in the range `[first, last)`, assigns `*i = value` and increments `value` as if by `++value`.

*Complexity:* Exactly `last - first` increments and assignments.

```
template<input_or_output_iterator O, sentinel_for<O> S, weakly_incrementable T>
requires indirectly_writable<O, const T&>
constexpr ranges::iota_result<O, T> ranges::iota(O first, S last, T value);
template<weakly_incrementable T, output_range<const T&> R>
constexpr ranges::iota_result<borrowed_iterator_t<R>, T> ranges::iota(R&& r, T value);
```

*Effects:* Equivalent to:

```
while (first != last) {
    *first = as_const(value);
    ++first;
```

<sup>223</sup>) The use of fully closed ranges is intentional.

```

    ++value;
}
return {std::move(first), std::move(value)};

```

#### 27.10.14 Greatest common divisor

[numeric.ops.gcd]

```

template<class M, class N>
constexpr common_type_t<M, N> gcd(M m, N n);

```

*Mandates:* M and N both are integer types other than *cv bool*.

*Preconditions:*  $|m|$  and  $|n|$  are representable as a value of `common_type_t<M, N>`.

NOTE These requirements ensure, for example, that `gcd(m, m) = |m|` is representable as a value of type M.

*Returns:* Zero when `m` and `n` are both zero. Otherwise, returns the greatest common divisor of  $|m|$  and  $|n|$ .

*Throws:* Nothing.

#### 27.10.15 Least common multiple

[numeric.ops.lcm]

```

template<class M, class N>
constexpr common_type_t<M, N> lcm(M m, N n);

```

*Mandates:* M and N both are integer types other than *cv bool*.

*Preconditions:*  $|m|$  and  $|n|$  are representable as a value of `common_type_t<M, N>`. The least common multiple of  $|m|$  and  $|n|$  is representable as a value of type `common_type_t<M, N>`.

*Returns:* Zero when either `m` or `n` is zero. Otherwise, returns the least common multiple of  $|m|$  and  $|n|$ .

*Throws:* Nothing.

#### 27.10.16 Midpoint

[numeric.ops.midpoint]

```

template<class T>
constexpr T midpoint(T a, T b) noexcept;

```

*Constraints:* T is an arithmetic type other than *bool*.

*Returns:* Half the sum of `a` and `b`. If T is an integer type and the sum is odd, the result is rounded towards `a`.

*Remarks:* No overflow occurs. If T is a floating-point type, at most one inexact operation occurs.

```

template<class T>
constexpr T* midpoint(T* a, T* b);

```

*Constraints:* T is an object type.

*Mandates:* T is a complete type.

*Preconditions:* `a` and `b` point to, respectively, elements *i* and *j* of the same array object `x`.

NOTE As specified in 6.8.4, an object that is not an array element is considered to belong to a single-element array for this purpose and a pointer past the last element of an array of *n* elements is considered to be equivalent to a pointer to a hypothetical array element *n* for this purpose.

*Returns:* A pointer to array element  $i + \frac{j-i}{2}$  of `x`, where the result of the division is truncated towards zero.

### 27.11 Specialized <memory> algorithms

[specialized.algorithms]

#### 27.11.1 General

[specialized.algorithms.general]

The contents specified in 27.11 are declared in the header `<memory>` (20.2.2).

Unless otherwise specified, if an exception is thrown in the following algorithms, objects constructed by a placement *new-expression* (7.6.2.8) are destroyed in an unspecified order before allowing the exception to propagate.

Some algorithms specified in 27.11 make use of the exposition-only function *voidify*:

```
template<class T>
constexpr void* voidify(T& obj) noexcept {
    return addressof(obj);
}
```

### 27.11.2 Special memory concepts

[special.mem.concepts]

Some algorithms in this subclause are constrained with the following exposition-only concepts:

```
template<class I>
concept nothrow-input-iterator = // exposition only
    input_iterator<I> &&
    is_lvalue_reference_v<iter_reference_t<I>> &&
    same_as<remove_cvref_t<iter_reference_t<I>>, iter_value_t<I>>;
```

A type *I* models *nothrow-input-iterator* only if no exceptions are thrown from increment, copy construction, move construction, copy assignment, move assignment, or indirection through valid iterators.

NOTE 1 This concept allows some *input\_iterator* (25.3.4.9) operations to throw exceptions.

```
template<class S, class I>
concept nothrow-sentinel-for = sentinel_for<S, I>; // exposition only
```

Types *S* and *I* model *nothrow-sentinel-for* only if no exceptions are thrown from copy construction, move construction, copy assignment, move assignment, or comparisons between valid values of type *I* and *S*.

NOTE 2 This concept allows some *sentinel\_for* (25.3.4.7) operations to throw exceptions.

```
template<class R>
concept nothrow-input-range = // exposition only
    range<R> &&
    nothrow-input-iterator<iterator_t<R>> &&
    nothrow-sentinel-for<sentinel_t<R>, iterator_t<R>>;
```

A type *R* models *nothrow-input-range* only if no exceptions are thrown from calls to *ranges::begin* and *ranges::end* on an object of type *R*.

```
template<class I>
concept nothrow-forward-iterator = // exposition only
    nothrow-input-iterator<I> &&
    forward_iterator<I> &&
    nothrow-sentinel-for<I, I>;
```

NOTE 3 This concept allows some *forward\_iterator* (25.3.4.11) operations to throw exceptions.

```
template<class R>
concept nothrow-forward-range = // exposition only
    nothrow-input-range<R> &&
    nothrow-forward-iterator<iterator_t<R>>;
```

### 27.11.3 uninitialized\_default\_construct

[uninitialized.construct.default]

```
template<class NoThrowForwardIterator>
void uninitialized_default_construct(NoThrowForwardIterator first, NoThrowForwardIterator last);
```

*Effects:* Equivalent to:

```
for (; first != last; ++first)
    ::new (voidify(*first))
        typename iterator_traits<NoThrowForwardIterator>::value_type;
```

```
namespace ranges {
    template<nothrow-forward-iterator I, nothrow-sentinel-for<I> S>
    requires default_initializable<iter_value_t<I>>
    I uninitialized_default_construct(I first, S last);
}
```

```
template<nothrow-forward-range R>
  requires default_initializable<range_value_t<R>>
  borrowed_iterator_t<R> uninitialized_default_construct(R&& r);
}
```

*Effects:* Equivalent to:

```
for (; first != last; ++first)
  ::new (voidify(*first)) remove_reference_t<iter_reference_t<I>>;
return first;
```

```
template<class NoThrowForwardIterator, class Size>
  NoThrowForwardIterator uninitialized_default_construct_n(NoThrowForwardIterator first, Size n);
```

*Effects:* Equivalent to:

```
for (; n > 0; (void)++first, --n)
  ::new (voidify(*first))
    typename iterator_traits<NoThrowForwardIterator>::value_type;
return first;
```

```
namespace ranges {
  template<nothrow-forward-iterator I>
    requires default_initializable<iter_value_t<I>>
    I uninitialized_default_construct_n(I first, iter_difference_t<I> n);
}
```

*Effects:* Equivalent to:

```
return uninitialized_default_construct(counted_iterator(first, n),
                                     default_sentinel).base();
```

#### 27.11.4 uninitialized\_value\_construct [uninitialized.construct.value]

```
template<class NoThrowForwardIterator>
  void uninitialized_value_construct(NoThrowForwardIterator first, NoThrowForwardIterator last);
```

*Effects:* Equivalent to:

```
for (; first != last; ++first)
  ::new (voidify(*first))
    typename iterator_traits<NoThrowForwardIterator>::value_type();
```

```
namespace ranges {
  template<nothrow-forward-iterator I, nothrow-sentinel-for<I> S>
    requires default_initializable<iter_value_t<I>>
    I uninitialized_value_construct(I first, S last);
  template<nothrow-forward-range R>
    requires default_initializable<range_value_t<R>>
    borrowed_iterator_t<R> uninitialized_value_construct(R&& r);
}
```

*Effects:* Equivalent to:

```
for (; first != last; ++first)
  ::new (voidify(*first)) remove_reference_t<iter_reference_t<I>>();
return first;
```

```
template<class NoThrowForwardIterator, class Size>
  NoThrowForwardIterator uninitialized_value_construct_n(NoThrowForwardIterator first, Size n);
```

*Effects:* Equivalent to:

```
for (; n > 0; (void)++first, --n)
  ::new (voidify(*first))
    typename iterator_traits<NoThrowForwardIterator>::value_type();
return first;
```

```
namespace ranges {
  template<nothrow-forward-iterator I>
    requires default_initializable<iter_value_t<I>>
    I uninitialized_value_construct_n(I first, iter_difference_t<I> n);
}
```

}

*Effects:* Equivalent to:

```
return uninitialized_value_construct(counted_iterator(first, n),
                                   default_sentinel).base();
```

**27.11.5 uninitialized\_copy****[uninitialized.copy]**

```
template<class InputIterator, class NoThrowForwardIterator>
NoThrowForwardIterator uninitialized_copy(InputIterator first, InputIterator last,
                                       NoThrowForwardIterator result);
```

*Preconditions:*  $\text{result} + [0, (\text{last} - \text{first}))$  does not overlap with  $[\text{first}, \text{last})$ .*Effects:* Equivalent to:

```
for (; first != last; ++result, (void) ++first)
    ::new (voidify(*result))
        typename iterator_traits<NoThrowForwardIterator>::value_type(*first);
```

*Returns:* result.

```
namespace ranges {
template<input_iterator I, sentinel_for<I> S1,
        nothrow_forward_iterator O, nothrow_sentinel_for<O> S2>
requires constructible_from<iter_value_t<O>, iter_reference_t<I>>
uninitialized_copy_result<I, O>
uninitialized_copy(I ifirst, S1 ilast, O ofirst, S2 olast);
template<input_range IR, nothrow_forward_range OR>
requires constructible_from<range_value_t<OR>, range_reference_t<IR>>
uninitialized_copy_result<borrowed_iterator_t<IR>, borrowed_iterator_t<OR>>
uninitialized_copy(IR&& in_range, OR&& out_range);
}
```

*Preconditions:*  $[\text{ofirst}, \text{olast})$  does not overlap with  $[\text{ifirst}, \text{ilast})$ .*Effects:* Equivalent to:

```
for (; ifirst != ilast && ofirst != olast; ++ofirst, (void)++ifirst)
    ::new (voidify(*ofirst)) remove_reference_t<iter_reference_t<O>>(*ifirst);
return {std::move(ifirst), ofirst};
```

```
template<class InputIterator, class Size, class NoThrowForwardIterator>
NoThrowForwardIterator uninitialized_copy_n(InputIterator first, Size n,
                                           NoThrowForwardIterator result);
```

*Preconditions:*  $\text{result} + [0, n)$  does not overlap with  $\text{first} + [0, n)$ .*Effects:* Equivalent to:

```
for (; n > 0; ++result, (void) ++first, --n)
    ::new (voidify(*result))
        typename iterator_traits<NoThrowForwardIterator>::value_type(*first);
```

*Returns:* result.

```
namespace ranges {
template<input_iterator I, nothrow_forward_iterator O, nothrow_sentinel_for<O> S>
requires constructible_from<iter_value_t<O>, iter_reference_t<I>>
uninitialized_copy_n_result<I, O>
uninitialized_copy_n(I ifirst, iter_difference_t<I> n, O ofirst, S olast);
}
```

*Preconditions:*  $[\text{ofirst}, \text{olast})$  does not overlap with  $\text{ifirst} + [0, n)$ .*Effects:* Equivalent to:

```
auto t = uninitialized_copy(counted_iterator(std::move(ifirst), n),
                             default_sentinel, ofirst, olast);
return {std::move(t.in).base(), t.out};
```

## 27.11.6 uninitialized\_move

[uninitialized.move]

```
template<class InputIterator, class NoThrowForwardIterator>
NoThrowForwardIterator uninitialized_move(InputIterator first, InputIterator last,
                                         NoThrowForwardIterator result);
```

*Preconditions:* result + [0, (last - first)) does not overlap with [first, last).

*Effects:* Equivalent to:

```
for (; first != last; (void)++result, ++first)
    ::new (voidify(*result))
        typename iterator_traits<NoThrowForwardIterator>::value_type(std::move(*first));
return result;
```

```
namespace ranges {
template<input_iterator I, sentinel_for<I> S1,
        nothrow_forward_iterator O, nothrow_sentinel_for<O> S2>
requires constructible_from<iter_value_t<O>, iter_rvalue_reference_t<I>>
uninitialized_move_result<I, O>
uninitialized_move(I ifirst, S1 ilast, O ofirst, S2 olast);
template<input_range IR, nothrow_forward_range OR>
requires constructible_from<range_value_t<OR>, range_rvalue_reference_t<IR>>
uninitialized_move_result<borrowed_iterator_t<IR>, borrowed_iterator_t<OR>>
uninitialized_move(IR&& in_range, OR&& out_range);
}
```

*Preconditions:* [ofirst, olast) does not overlap with [ifirst, ilast).

*Effects:* Equivalent to:

```
for (; ifirst != ilast && ofirst != olast; ++ofirst, (void)++ifirst)
    ::new (voidify(*ofirst))
        remove_reference_t<iter_reference_t<O>>(ranges::iter_move(ifirst));
return {std::move(ifirst), ofirst};
```

NOTE 1 If an exception is thrown, some objects in the range [ifirst, ilast) are left in a valid, but unspecified state.

```
template<class InputIterator, class Size, class NoThrowForwardIterator>
pair<InputIterator, NoThrowForwardIterator>
uninitialized_move_n(InputIterator first, Size n, NoThrowForwardIterator result);
```

*Preconditions:* result + [0, n) does not overlap with first + [0, n).

*Effects:* Equivalent to:

```
for (; n > 0; ++result, (void) ++first, --n)
    ::new (voidify(*result))
        typename iterator_traits<NoThrowForwardIterator>::value_type(std::move(*first));
return {first, result};
```

```
namespace ranges {
template<input_iterator I, nothrow_forward_iterator O, nothrow_sentinel_for<O> S>
requires constructible_from<iter_value_t<O>, iter_rvalue_reference_t<I>>
uninitialized_move_n_result<I, O>
uninitialized_move_n(I ifirst, iter_difference_t<I> n, O ofirst, S olast);
}
```

*Preconditions:* [ofirst, olast) does not overlap with ifirst + [0, n).

*Effects:* Equivalent to:

```
auto t = uninitialized_move(counted_iterator(std::move(ifirst), n),
                                default_sentinel, ofirst, olast);
return {std::move(t.in).base(), t.out};
```

NOTE 2 If an exception is thrown, some objects in the range ifirst + [0, n) are left in a valid but unspecified state.

**27.11.7 uninitialized\_fill****[uninitialized.fill]**

```
template<class NoThrowForwardIterator, class T>
void uninitialized_fill(NoThrowForwardIterator first, NoThrowForwardIterator last, const T& x);
```

*Effects:* Equivalent to:

```
for (; first != last; ++first)
    ::new (voidify(*first))
        typename iterator_traits<NoThrowForwardIterator>::value_type(x);
```

```
namespace ranges {
    template<nothrow-forward-iterator I, nothrow-sentinel-for<I> S, class T>
        requires constructible_from<iter_value_t<I>, const T&>
        I uninitialized_fill(I first, S last, const T& x);
    template<nothrow-forward-range R, class T>
        requires constructible_from<range_value_t<R>, const T&>
        borrowed_iterator_t<R> uninitialized_fill(R&& r, const T& x);
}
```

*Effects:* Equivalent to:

```
for (; first != last; ++first)
    ::new (voidify(*first)) remove_reference_t<iter_reference_t<I>>(x);
return first;
```

```
template<class NoThrowForwardIterator, class Size, class T>
NoThrowForwardIterator uninitialized_fill_n(NoThrowForwardIterator first, Size n, const T& x);
```

*Effects:* Equivalent to:

```
for (; n--; ++first)
    ::new (voidify(*first))
        typename iterator_traits<NoThrowForwardIterator>::value_type(x);
return first;
```

```
namespace ranges {
    template<nothrow-forward-iterator I, class T>
        requires constructible_from<iter_value_t<I>, const T&>
        I uninitialized_fill_n(I first, iter_difference_t<I> n, const T& x);
}
```

*Effects:* Equivalent to:

```
return uninitialized_fill(counted_iterator(first, n), default_sentinel, x).base();
```

**27.11.8 construct\_at****[specialized.construct]**

```
template<class T, class... Args>
constexpr T* construct_at(T* location, Args&&... args);
```

```
namespace ranges {
    template<class T, class... Args>
        constexpr T* construct_at(T* location, Args&&... args);
}
```

*Constraints:* The expression `::new (declval<void*>()) T(declval<Args>())...` is well-formed when treated as an unevaluated operand (7.2.3).

*Effects:* Equivalent to:

```
return ::new (voidify(*location)) T(std::forward<Args>(args)...);
```

**27.11.9 destroy****[specialized.destroy]**

```
template<class T>
constexpr void destroy_at(T* location);
namespace ranges {
    template<destructible T>
        constexpr void destroy_at(T* location) noexcept;
```

}

*Effects:*

- If T is an array type, equivalent to `destroy(begin(*location), end(*location))`.
- Otherwise, equivalent to `location->~T()`.

```
template<class NoThrowForwardIterator>
constexpr void destroy(NoThrowForwardIterator first, NoThrowForwardIterator last);
```

*Effects:* Equivalent to:

```
for (; first != last; ++first)
    destroy_at(addressof(*first));
```

```
namespace ranges {
    template<nothrow-input-iterator I, nothrow-sentinel-for<I> S>
        requires destructible<iter_value_t<I>>
        constexpr I destroy(I first, S last) noexcept;
    template<nothrow-input-range R>
        requires destructible<range_value_t<R>>
        constexpr borrowed_iterator_t<R> destroy(R&& r) noexcept;
}
```

*Effects:* Equivalent to:

```
for (; first != last; ++first)
    destroy_at(addressof(*first));
return first;
```

```
template<class NoThrowForwardIterator, class Size>
constexpr NoThrowForwardIterator destroy_n(NoThrowForwardIterator first, Size n);
```

*Effects:* Equivalent to:

```
for (; n > 0; (void)++first, --n)
    destroy_at(addressof(*first));
return first;
```

```
namespace ranges {
    template<nothrow-input-iterator I>
        requires destructible<iter_value_t<I>>
        constexpr I destroy_n(I first, iter_difference_t<I> n) noexcept;
}
```

*Effects:* Equivalent to:

```
return destroy(counted_iterator(std::move(first), n), default_sentinel).base();
```

## 27.12 C library algorithms

[alg.c.library]

NOTE The header `<stdlib.h>` (17.2.2) declares the functions described in this subclause.

```
void* bsearch(const void* key, const void* base, size_t nmemb, size_t size,
    c-compare-pred* compar);
void* bsearch(const void* key, const void* base, size_t nmemb, size_t size,
    compare-pred* compar);
void qsort(void* base, size_t nmemb, size_t size, c-compare-pred* compar);
void qsort(void* base, size_t nmemb, size_t size, compare-pred* compar);
```

*Preconditions:* For `qsort`, the objects in the array pointed to by `base` are of trivially copyable type.

*Effects:* These functions have the semantics specified in the C standard library.

*Throws:* Any exception thrown by `compar` (16.4.6.13).

See also ISO/IEC 9899:2018, 7.22.5.

## 28 Numerics library

[numerics]

### 28.1 General

[numerics.general]

This Clause describes components that C++ programs may use to perform seminumerical operations.

The following subclauses describe components for complex number types, random number generation, numeric (*n*-at-a-time) arrays, generalized numeric algorithms, and mathematical constants and functions for floating-point types, as summarized in Table 94.

Table 94 — Numerics library summary [tab:numerics.summary]

| Subclause                                            | Header             |
|------------------------------------------------------|--------------------|
| 28.2 Requirements                                    |                    |
| 28.3 Floating-point environment                      | <cfenv>            |
| 28.4 Complex numbers                                 | <complex>          |
| 28.5 Random number generation                        | <random>           |
| 28.6 Numeric arrays                                  | <valarray>         |
| 28.7 Mathematical functions for floating-point types | <cmath>, <cstdlib> |
| 28.8 Numbers                                         | <numbers>          |

### 28.2 Numeric type requirements

[numeric.requirements]

The `complex` and `valarray` components are parameterized by the type of information they contain and manipulate. A C++ program shall instantiate these components only with a numeric type. A *numeric type* is a cv-unqualified object type *T* that meets the *Cpp17DefaultConstructible*, *Cpp17CopyConstructible*, *Cpp17CopyAssignable*, and *Cpp17Destructible* requirements (16.4.4.2).<sup>224</sup>

If any operation on *T* throws an exception the effects are undefined.

In addition, many member and related functions of `valarray<T>` can be successfully instantiated and will exhibit well-defined behavior if and only if *T* meets additional requirements specified for each such member or related function.

EXAMPLE It is valid to instantiate `valarray<complex>`, but `operator>()` will not be successfully instantiated for `valarray<complex>` operands, since `complex` does not have any ordering operators.

### 28.3 The floating-point environment

[cfenv]

#### 28.3.1 Header <cfenv> synopsis

[cfenv.syn]

```
#define FE_ALL_EXCEPT see below
#define FE_DIVBYZERO see below    // optional
#define FE_INEXACT see below      // optional
#define FE_INVALID see below      // optional
#define FE_OVERFLOW see below     // optional
#define FE_UNDERFLOW see below    // optional

#define FE_DOWNWARD see below     // optional
#define FE_TONEAREST see below    // optional
#define FE_TOWARDZERO see below   // optional
#define FE_UPWARD see below       // optional

#define FE_DFL_ENV see below

namespace std {
    // types
    using fenv_t    = object type;
    using fexcept_t = integer type;
```

<sup>224</sup>) In other words, value types. These include arithmetic types, pointers, the library class `complex`, and instantiations of `valarray` for value types.

```

// functions
int feclearexcept(int except);
int fegetexceptflag(fexcept_t* pflag, int except);
int feraiseexcept(int except);
int fesetexceptflag(const fexcept_t* pflag, int except);
int fetestexcept(int except);

int fegetround();
int fesetround(int mode);

int fegetenv(fenv_t* penv);
int feholdexcept(fenv_t* penv);
int fesetenv(const fenv_t* penv);
int feupdateenv(const fenv_t* penv);
}

```

The contents and meaning of the header `<cfenv>` are the same as the C standard library header `<fenv.h>`.

NOTE This document does not require an implementation to support the `FENV_ACCESS` pragma; it is implementation-defined (15.9) whether the pragma is supported. As a consequence, it is implementation-defined whether these functions can be used to test floating-point status flags, set floating-point control modes, or run under non-default mode settings. If the pragma is used to enable control over the floating-point environment, this document does not specify the effect on floating-point evaluation in constant expressions.

See also ISO/IEC 9899:2018, 7.6.

### 28.3.2 Threads

[cfenv.thread]

The floating-point environment has thread storage duration (6.7.5.3). The initial state for a thread's floating-point environment is the state of the floating-point environment of the thread that constructs the corresponding `thread` object (33.4.3) or `jthread` object (33.4.4) at the time it constructed the object.

NOTE That is, the child thread gets the floating-point state of the parent thread at the time of the child's creation.

A separate floating-point environment is maintained for each thread. Each function accesses the environment corresponding to its calling thread.

## 28.4 Complex numbers

[complex.numbers]

### 28.4.1 General

[complex.numbers.general]

The header `<complex>` defines a class template, and numerous functions for representing and manipulating complex numbers.

The effect of instantiating the template `complex` for any type that is not a cv-unqualified floating-point type (6.8.2) is unspecified. Specializations of `complex` for cv-unqualified floating-point types are trivially-copyable literal types (6.8.1).

If the result of a function is not mathematically defined or not in the range of representable values for its type, the behavior is undefined.

If `z` is an lvalue of type `cv complex<T>` then:

- the expression `reinterpret_cast<cv T(&)[2]>(z)` is well-formed,
- `reinterpret_cast<cv T(&)[2]>(z)[0]` designates the real part of `z`, and
- `reinterpret_cast<cv T(&)[2]>(z)[1]` designates the imaginary part of `z`.

Moreover, if `a` is an expression of type `cv complex<T>*` and the expression `a[i]` is well-defined for an integer expression `i`, then:

- `reinterpret_cast<cv T*>(a)[2*i]` designates the real part of `a[i]`, and
- `reinterpret_cast<cv T*>(a)[2*i + 1]` designates the imaginary part of `a[i]`.

### 28.4.2 Header `<complex>` synopsis

[complex.syn]

```

namespace std {
    // 28.4.3, class template complex
    template<class T> class complex;
}

```

// 28.4.6, operators

```
template<class T> constexpr complex<T> operator+(const complex<T>&, const complex<T>&);
template<class T> constexpr complex<T> operator+(const complex<T>&, const T&);
template<class T> constexpr complex<T> operator+(const T&, const complex<T>&);

template<class T> constexpr complex<T> operator-(const complex<T>&, const complex<T>&);
template<class T> constexpr complex<T> operator-(const complex<T>&, const T&);
template<class T> constexpr complex<T> operator-(const T&, const complex<T>&);

template<class T> constexpr complex<T> operator*(const complex<T>&, const complex<T>&);
template<class T> constexpr complex<T> operator*(const complex<T>&, const T&);
template<class T> constexpr complex<T> operator*(const T&, const complex<T>&);

template<class T> constexpr complex<T> operator/(const complex<T>&, const complex<T>&);
template<class T> constexpr complex<T> operator/(const complex<T>&, const T&);
template<class T> constexpr complex<T> operator/(const T&, const complex<T>&);

template<class T> constexpr complex<T> operator+(const complex<T>&);
template<class T> constexpr complex<T> operator-(const complex<T>&);

template<class T> constexpr bool operator==(const complex<T>&, const complex<T>&);
template<class T> constexpr bool operator==(const complex<T>&, const T&);

template<class T, class charT, class traits>
    basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>&, complex<T>&);

template<class T, class charT, class traits>
    basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>&, const complex<T>&);
```

// 28.4.7, values

```
template<class T> constexpr T real(const complex<T>&);
template<class T> constexpr T imag(const complex<T>&);

template<class T> T abs(const complex<T>&);
template<class T> T arg(const complex<T>&);
template<class T> constexpr T norm(const complex<T>&);

template<class T> constexpr complex<T> conj(const complex<T>&);
template<class T> complex<T> proj(const complex<T>&);
template<class T> complex<T> polar(const T&, const T& = T());
```

// 28.4.8, transcendentals

```
template<class T> complex<T> acos(const complex<T>&);
template<class T> complex<T> asin(const complex<T>&);
template<class T> complex<T> atan(const complex<T>&);

template<class T> complex<T> acosh(const complex<T>&);
template<class T> complex<T> asinh(const complex<T>&);
template<class T> complex<T> atanh(const complex<T>&);

template<class T> complex<T> cos (const complex<T>&);
template<class T> complex<T> cosh (const complex<T>&);
template<class T> complex<T> exp (const complex<T>&);
template<class T> complex<T> log (const complex<T>&);
template<class T> complex<T> log10(const complex<T>&);

template<class T> complex<T> pow (const complex<T>&, const T&);
template<class T> complex<T> pow (const complex<T>&, const complex<T>&);
template<class T> complex<T> pow (const T&, const complex<T>&);

template<class T> complex<T> sin (const complex<T>&);
template<class T> complex<T> sinh (const complex<T>&);
template<class T> complex<T> sqrt (const complex<T>&);
template<class T> complex<T> tan (const complex<T>&);
```

```

template<class T> complex<T> tanh (const complex<T>&);

// 28.4.10, complex literals
inline namespace literals {
inline namespace complex_literals {
    constexpr complex<long double> operator""il(long double);
    constexpr complex<long double> operator""il(unsigned long long);
    constexpr complex<double> operator""i(long double);
    constexpr complex<double> operator""i(unsigned long long);
    constexpr complex<float> operator""if(long double);
    constexpr complex<float> operator""if(unsigned long long);
}
}
}

```

### 28.4.3 Class template complex

[complex]

```

namespace std {
    template<class T> class complex {
    public:
        using value_type = T;

        constexpr complex(const T& re = T(), const T& im = T());
        constexpr complex(const complex&) = default;
        template<class X> constexpr explicit(see below) complex(const complex<X>&);

        constexpr T real() const;
        constexpr void real(T);
        constexpr T imag() const;
        constexpr void imag(T);

        constexpr complex& operator= (const T&);
        constexpr complex& operator+=(const T&);
        constexpr complex& operator-=(const T&);
        constexpr complex& operator*=(const T&);
        constexpr complex& operator/=(const T&);

        constexpr complex& operator=(const complex&);
        template<class X> constexpr complex& operator= (const complex<X>&);
        template<class X> constexpr complex& operator+=(const complex<X>&);
        template<class X> constexpr complex& operator-=(const complex<X>&);
        template<class X> constexpr complex& operator*=(const complex<X>&);
        template<class X> constexpr complex& operator/=(const complex<X>&);
    };
}

```

The class `complex` describes an object that can store the Cartesian components, `real()` and `imag()`, of a complex number.

### 28.4.4 Member functions

[complex.members]

```
constexpr complex(const T& re = T(), const T& im = T());
```

*Postconditions:* `real() == re && imag() == im` is true.

```
template<class X> constexpr explicit(see below) complex(const complex<X>& other);
```

*Effects:* Initializes the real part with `other.real()` and the imaginary part with `other.imag()`.

*Remarks:* The expression inside `explicit` evaluates to `false` if and only if the floating-point conversion rank of `T` is greater than or equal to the floating-point conversion rank of `X`.

```
constexpr T real() const;
```

*Returns:* The value of the real component.

```
constexpr void real(T val);
```

*Effects:* Assigns `val` to the real component.

```
constexpr T imag() const;
```

*Returns:* The value of the imaginary component.

```
constexpr void imag(T val);
```

*Effects:* Assigns `val` to the imaginary component.

### 28.4.5 Member operators

[complex.member.ops]

```
constexpr complex& operator+=(const T& rhs);
```

*Effects:* Adds the scalar value `rhs` to the real part of the complex value `*this` and stores the result in the real part of `*this`, leaving the imaginary part unchanged.

*Returns:* `*this`.

```
constexpr complex& operator-=(const T& rhs);
```

*Effects:* Subtracts the scalar value `rhs` from the real part of the complex value `*this` and stores the result in the real part of `*this`, leaving the imaginary part unchanged.

*Returns:* `*this`.

```
constexpr complex& operator*=(const T& rhs);
```

*Effects:* Multiplies the scalar value `rhs` by the complex value `*this` and stores the result in `*this`.

*Returns:* `*this`.

```
constexpr complex& operator/=(const T& rhs);
```

*Effects:* Divides the scalar value `rhs` into the complex value `*this` and stores the result in `*this`.

*Returns:* `*this`.

```
template<class X> constexpr complex& operator+=(const complex<X>& rhs);
```

*Effects:* Adds the complex value `rhs` to the complex value `*this` and stores the sum in `*this`.

*Returns:* `*this`.

```
template<class X> constexpr complex& operator-=(const complex<X>& rhs);
```

*Effects:* Subtracts the complex value `rhs` from the complex value `*this` and stores the difference in `*this`.

*Returns:* `*this`.

```
template<class X> constexpr complex& operator*=(const complex<X>& rhs);
```

*Effects:* Multiplies the complex value `rhs` by the complex value `*this` and stores the product in `*this`.

*Returns:* `*this`.

```
template<class X> constexpr complex& operator/=(const complex<X>& rhs);
```

*Effects:* Divides the complex value `rhs` into the complex value `*this` and stores the quotient in `*this`.

*Returns:* `*this`.

### 28.4.6 Non-member operations

[complex.ops]

```
template<class T> constexpr complex<T> operator+(const complex<T>& lhs);
```

*Returns:* `complex<T>(lhs)`.

```
template<class T> constexpr complex<T> operator+(const complex<T>& lhs, const complex<T>& rhs);
```

```
template<class T> constexpr complex<T> operator+(const complex<T>& lhs, const T& rhs);
```

```
template<class T> constexpr complex<T> operator+(const T& lhs, const complex<T>& rhs);
```

*Returns:* `complex<T>(lhs) += rhs`.

```
template<class T> constexpr complex<T> operator-(const complex<T>& lhs);
```

*Returns:* `complex<T>(-lhs.real(), -lhs.imag())`.

```
template<class T> constexpr complex<T> operator-(const complex<T>& lhs, const complex<T>& rhs);
template<class T> constexpr complex<T> operator-(const complex<T>& lhs, const T& rhs);
template<class T> constexpr complex<T> operator-(const T& lhs, const complex<T>& rhs);
```

*Returns:* `complex<T>(lhs) -= rhs`.

```
template<class T> constexpr complex<T> operator*(const complex<T>& lhs, const complex<T>& rhs);
template<class T> constexpr complex<T> operator*(const complex<T>& lhs, const T& rhs);
template<class T> constexpr complex<T> operator*(const T& lhs, const complex<T>& rhs);
```

*Returns:* `complex<T>(lhs) *= rhs`.

```
template<class T> constexpr complex<T> operator/(const complex<T>& lhs, const complex<T>& rhs);
template<class T> constexpr complex<T> operator/(const complex<T>& lhs, const T& rhs);
template<class T> constexpr complex<T> operator/(const T& lhs, const complex<T>& rhs);
```

*Returns:* `complex<T>(lhs) /= rhs`.

```
template<class T> constexpr bool operator==(const complex<T>& lhs, const complex<T>& rhs);
template<class T> constexpr bool operator==(const complex<T>& lhs, const T& rhs);
```

*Returns:* `lhs.real() == rhs.real() && lhs.imag() == rhs.imag()`.

*Remarks:* The imaginary part is assumed to be `T()`, or 0.0, for the `T` arguments.

```
template<class T, class charT, class traits>
basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>& is, complex<T>& x);
```

*Preconditions:* The input values are convertible to `T`.

*Effects:* Extracts a complex number `x` of the form: `u`, `(u)`, or `(u,v)`, where `u` is the real part and `v` is the imaginary part (31.7.5.3).

If bad input is encountered, calls `is.setstate(ios_base::failbit)` (which may throw `ios_base::failure` (31.5.4.4)).

*Returns:* `is`.

*Remarks:* This extraction is performed as a series of simpler extractions. Therefore, the skipping of whitespace is specified to be the same for each of the simpler extractions.

```
template<class T, class charT, class traits>
basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& o, const complex<T>& x);
```

*Effects:* Inserts the complex number `x` onto the stream `o` as if it were implemented as follows:

```
basic_ostringstream<charT, traits> s;
s.flags(o.flags());
s.imbue(o.getloc());
s.precision(o.precision());
s << '(' << x.real() << ',' << x.imag() << ')';
return o << s.str();
```

NOTE In a locale in which comma is used as a decimal point character, the use of comma as a field separator can be ambiguous. Inserting `showpoint` into the output stream forces all outputs to show an explicit decimal point character; as a result, all inserted sequences of complex numbers can be extracted unambiguously.

## 28.4.7 Value operations

[complex.value.ops]

```
template<class T> constexpr T real(const complex<T>& x);
```

*Returns:* `x.real()`.

```
template<class T> constexpr T imag(const complex<T>& x);
```

*Returns:* `x.imag()`.

```
template<class T> T abs(const complex<T>& x);
```

*Returns:* The magnitude of `x`.

```
template<class T> T arg(const complex<T>& x);
```

*Returns:* The phase angle of  $x$ , or  $\text{atan2}(\text{imag}(x), \text{real}(x))$ .

```
template<class T> constexpr T norm(const complex<T>& x);
```

*Returns:* The squared magnitude of  $x$ .

```
template<class T> constexpr complex<T> conj(const complex<T>& x);
```

*Returns:* The complex conjugate of  $x$ .

```
template<class T> complex<T> proj(const complex<T>& x);
```

*Returns:* The projection of  $x$  onto the Riemann sphere.

*Remarks:* Behaves the same as the C function `cproj`. See also ISO/IEC 9899:2018, 7.3.9.5.

```
template<class T> complex<T> polar(const T& rho, const T& theta = T());
```

*Preconditions:*  $\text{rho}$  is non-negative and non-NaN.  $\text{theta}$  is finite.

*Returns:* The complex value corresponding to a complex number whose magnitude is  $\text{rho}$  and whose phase angle is  $\text{theta}$ .

## 28.4.8 Transcendentals

[`complex.transcendentals`]

```
template<class T> complex<T> acos(const complex<T>& x);
```

*Returns:* The complex arc cosine of  $x$ .

*Remarks:* Behaves the same as the C function `cacos`. See also ISO/IEC 9899:2018, 7.3.5.1.

```
template<class T> complex<T> asin(const complex<T>& x);
```

*Returns:* The complex arc sine of  $x$ .

*Remarks:* Behaves the same as the C function `casin`. See also ISO/IEC 9899:2018, 7.3.5.2.

```
template<class T> complex<T> atan(const complex<T>& x);
```

*Returns:* The complex arc tangent of  $x$ .

*Remarks:* Behaves the same as the C function `catan`. See also ISO/IEC 9899:2018, 7.3.5.3.

```
template<class T> complex<T> acosh(const complex<T>& x);
```

*Returns:* The complex arc hyperbolic cosine of  $x$ .

*Remarks:* Behaves the same as the C function `cacosh`. See also ISO/IEC 9899:2018, 7.3.6.1.

```
template<class T> complex<T> asinh(const complex<T>& x);
```

*Returns:* The complex arc hyperbolic sine of  $x$ .

*Remarks:* Behaves the same as the C function `casinh`. See also ISO/IEC 9899:2018, 7.3.6.2.

```
template<class T> complex<T> atanh(const complex<T>& x);
```

*Returns:* The complex arc hyperbolic tangent of  $x$ .

*Remarks:* Behaves the same as the C function `catanh`. See also ISO/IEC 9899:2018, 7.3.6.3.

```
template<class T> complex<T> cos(const complex<T>& x);
```

*Returns:* The complex cosine of  $x$ .

```
template<class T> complex<T> cosh(const complex<T>& x);
```

*Returns:* The complex hyperbolic cosine of  $x$ .

```
template<class T> complex<T> exp(const complex<T>& x);
```

*Returns:* The complex base- $e$  exponential of  $x$ .

```
template<class T> complex<T> log(const complex<T>& x);
```

*Returns:* The complex natural (base- $e$ ) logarithm of  $x$ . For all  $x$ ,  $\text{imag}(\log(x))$  lies in the interval  $[-\pi, \pi]$ .

NOTE 1 The semantics of this function are intended to be the same in C++ as they are for `clog` in C.

*Remarks:* The branch cuts are along the negative real axis.

```
template<class T> complex<T> log10(const complex<T>& x);
```

*Returns:* The complex common (base-10) logarithm of  $x$ , defined as  $\log(x) / \log(10)$ .

*Remarks:* The branch cuts are along the negative real axis.

```
template<class T> complex<T> pow(const complex<T>& x, const complex<T>& y);
```

```
template<class T> complex<T> pow(const complex<T>& x, const T& y);
```

```
template<class T> complex<T> pow(const T& x, const complex<T>& y);
```

*Returns:* The complex power of base  $x$  raised to the  $y^{\text{th}}$  power, defined as  $\exp(y * \log(x))$ . The value returned for `pow(0, 0)` is implementation-defined.

*Remarks:* The branch cuts are along the negative real axis.

```
template<class T> complex<T> sin(const complex<T>& x);
```

*Returns:* The complex sine of  $x$ .

```
template<class T> complex<T> sinh(const complex<T>& x);
```

*Returns:* The complex hyperbolic sine of  $x$ .

```
template<class T> complex<T> sqrt(const complex<T>& x);
```

*Returns:* The complex square root of  $x$ , in the range of the right half-plane.

NOTE 2 The semantics of this function are intended to be the same in C++ as they are for `csqrt` in C.

*Remarks:* The branch cuts are along the negative real axis.

```
template<class T> complex<T> tan(const complex<T>& x);
```

*Returns:* The complex tangent of  $x$ .

```
template<class T> complex<T> tanh(const complex<T>& x);
```

*Returns:* The complex hyperbolic tangent of  $x$ .

#### 28.4.9 Additional overloads

[`cmplx.over`]

The following function templates shall have additional overloads:

|                   |                   |
|-------------------|-------------------|
| <code>arg</code>  | <code>norm</code> |
| <code>conj</code> | <code>proj</code> |
| <code>imag</code> | <code>real</code> |

where `norm`, `conj`, `imag`, and `real` are `constexpr` overloads.

The additional overloads shall be sufficient to ensure:

- If the argument has a floating-point type  $T$ , then it is effectively cast to `complex<T>`.
- Otherwise, if the argument has integer type, then it is effectively cast to `complex<double>`.

Function template `pow` has additional overloads sufficient to ensure, for a call with one argument of type `complex<T1>` and the other argument of type  $T2$  or `complex<T2>`, both arguments are effectively cast to `complex<common_type_t<T1, T2>>`. If `common_type_t<T1, T2>` is not well-formed, then the program is ill-formed.

#### 28.4.10 Suffixes for complex number literals

[`complex.literals`]

This subclause describes literal suffixes for constructing complex number literals. The suffixes `i`, `il`, and `if` create complex numbers of the types `complex<double>`, `complex<long double>`, and `complex<float>` respectively, with their imaginary part denoted by the given literal number and the real part being zero.

```
constexpr complex<long double> operator""il(long double d);
```

```
constexpr complex<long double> operator""il(unsigned long long d);
```

*Returns:* `complex<long double>{0.0L, static_cast<long double>(d)}`.

```
constexpr complex<double> operator""i(long double d);
constexpr complex<double> operator""i(unsigned long long d);

Returns: complex<double>{0.0, static_cast<double>(d)}.
```

```
constexpr complex<float> operator""if(long double d);
constexpr complex<float> operator""if(unsigned long long d);

Returns: complex<float>{0.0f, static_cast<float>(d)}.
```

## 28.5 Random number generation

[rand]

### 28.5.1 General

[rand.general]

Subclause 28.5 defines a facility for generating (pseudo-)random numbers.

In addition to a few utilities, four categories of entities are described: *uniform random bit generators*, *random number engines*, *random number engine adaptors*, and *random number distributions*. These categorizations are applicable to types that meet the corresponding requirements, to objects instantiated from such types, and to templates producing such types when instantiated.

NOTE These entities are specified in such a way as to permit the binding of any uniform random bit generator object *e* as the argument to any random number distribution object *d*, thus producing a zero-argument function object such as given by `bind(d,e)`.

Each of the entities specified in 28.5 has an associated arithmetic type (6.8.2) identified as `result_type`. With *T* as the `result_type` thus associated with such an entity, that entity is characterized:

- as *boolean* or equivalently as *boolean-valued*, if *T* is `bool`;
- otherwise as *integral* or equivalently as *integer-valued*, if `numeric_limits<T>::is_integer` is `true`;
- otherwise as *floating-point* or equivalently as *real-valued*.

If integer-valued, an entity may optionally be further characterized as *signed* or *unsigned*, according to `numeric_limits<T>::is_signed`.

Unless otherwise specified, all descriptions of calculations in 28.5 use mathematical real numbers.

Throughout 28.5, the operators `bitand`, `bitor`, and `xor` denote the respective conventional bitwise operations. Further:

- the operator `rshift` denotes a bitwise right shift with zero-valued bits appearing in the high bits of the result, and
- the operator `lshiftw` denotes a bitwise left shift with zero-valued bits appearing in the low bits of the result, and whose result is always taken modulo  $2^w$ .

```

### 28.5.3 Requirements

[rand.req]

#### 28.5.3.1 General requirements

[rand.req.genl]

Throughout 28.5, the effect of instantiating a template:

- that has a template type parameter named `Sseq` is undefined unless the corresponding template argument is cv-unqualified and meets the requirements of seed sequence (28.5.3.2).
- that has a template type parameter named `URBG` is undefined unless the corresponding template argument is cv-unqualified and meets the requirements of uniform random bit generator (28.5.3.3).

- that has a template type parameter named **Engine** is undefined unless the corresponding template argument is cv-unqualified and meets the requirements of random number engine (28.5.3.4).
- that has a template type parameter named **RealType** is undefined unless the corresponding template argument is cv-unqualified and is one of **float**, **double**, or **long double**.
- that has a template type parameter named **IntType** is undefined unless the corresponding template argument is cv-unqualified and is one of **short**, **int**, **long**, **long long**, **unsigned short**, **unsigned int**, **unsigned long**, or **unsigned long long**.
- that has a template type parameter named **UIntType** is undefined unless the corresponding template argument is cv-unqualified and is one of **unsigned short**, **unsigned int**, **unsigned long**, or **unsigned long long**.

Throughout 28.5, phrases of the form “**x** is an iterator of a specific kind” shall be interpreted as equivalent to the more formal requirement that “**x** is a value of a type meeting the requirements of the specified iterator type”.

Throughout 28.5, any constructor that can be called with a single argument and that meets a requirement specified in this subclause shall be declared **explicit**.

### 28.5.3.2 Seed sequence requirements [rand.req.seedseq]

A *seed sequence* is an object that consumes a sequence of integer-valued data and produces a requested number of unsigned integer values  $i$ ,  $0 \leq i < 2^{32}$ , based on the consumed data.

NOTE Such an object provides a mechanism to avoid replication of streams of random variates. This can be useful, for example, in applications requiring large numbers of random number engines.

A class **S** meets the requirements of a seed sequence if the expressions shown in Table 95 are valid and have the indicated semantics, and if **S** also meets all other requirements of 28.5.3.2. In Table 95 and throughout this subclause:

- **T** is the type named by **S**’s associated **result\_type**;
- **q** is a value of type **S** and **r** is a value of type **S** or **const S**;
- **ib** and **ie** are input iterators with an unsigned integer **value\_type** of at least 32 bits;
- **rb** and **re** are mutable random access iterators with an unsigned integer **value\_type** of at least 32 bits;
- **ob** is an output iterator; and
- **il** is a value of type **initializer\_list<T>**.

Table 95 — Seed sequence requirements [tab:rand.req.seedseq]

| Expression            | Return type | Pre/post-condition                                                                                                               | Complexity                             |
|-----------------------|-------------|----------------------------------------------------------------------------------------------------------------------------------|----------------------------------------|
| <b>S::result_type</b> | <b>T</b>    | <b>T</b> is an unsigned integer type (6.8.2) of at least 32 bits.                                                                | compile-time                           |
| <b>S()</b>            |             | Creates a seed sequence with the same initial state as all other default-constructed seed sequences of type <b>S</b> .           | constant                               |
| <b>S(ib, ie)</b>      |             | Creates a seed sequence having internal state that depends on some or all of the bits of the supplied sequence <b>[ib, ie)</b> . | $\mathcal{O}(\text{ie} - \text{ib})$   |
| <b>S(il)</b>          |             | Same as <b>S(il.begin(), il.end())</b> .                                                                                         | same as <b>S(il.begin(), il.end())</b> |

Table 95 — Seed sequence requirements (continued)

| Expression                     | Return type         | Pre/post-condition                                                                                                                                                                                                                                                              | Complexity                           |
|--------------------------------|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------|
| <code>q.generate(rb,re)</code> | <code>void</code>   | Does nothing if <code>rb == re</code> .<br>Otherwise, fills the supplied sequence <code>[rb,re)</code> with 32-bit quantities that depend on the sequence supplied to the constructor and possibly also depend on the history of <code>generate</code> 's previous invocations. | $\mathcal{O}(\text{re} - \text{rb})$ |
| <code>r.size()</code>          | <code>size_t</code> | The number of 32-bit units that would be copied by a call to <code>r.param</code> .                                                                                                                                                                                             | constant                             |
| <code>r.param(ob)</code>       | <code>void</code>   | Copies to the given destination a sequence of 32-bit units that can be provided to the constructor of a second object of type <code>S</code> , and that would reproduce in that second object a state indistinguishable from the state of the first object.                     | $\mathcal{O}(\text{r.size}())$       |

### 28.5.3.3 Uniform random bit generator requirements [rand.req.urng]

A *uniform random bit generator* `g` of type `G` is a function object returning unsigned integer values such that each value in the range of possible results has (ideally) equal probability of being returned.

NOTE The degree to which `g`'s results approximate the ideal is often determined statistically.

```
template<class G>
concept uniform_random_bit_generator =
    invocable<G&& && unsigned_integral<invoke_result_t<G&&>> &&
    requires {
        { G::min() } -> same_as<invoke_result_t<G&&>>;
        { G::max() } -> same_as<invoke_result_t<G&&>>;
        requires bool_constant<(G::min() < G::max())>::value;
    };

```

Let `g` be an object of type `G`. `G` models `uniform_random_bit_generator` only if

- `G::min() <= g()`,
- `g() <= G::max()`, and
- `g()` has amortized constant complexity.

A class `G` meets the *uniform random bit generator* requirements if `G` models `uniform_random_bit_generator`, `invoke_result_t<G&&>` is an unsigned integer type (6.8.2), and `G` provides a nested *typedef-name* `result_type` that denotes the same type as `invoke_result_t<G&&>`.

### 28.5.3.4 Random number engine requirements [rand.req.eng]

A *random number engine* (commonly shortened to *engine*) `e` of type `E` is a uniform random bit generator that additionally meets the requirements (e.g., for seeding and for input/output) specified in this subclause.

At any given time, `e` has a state `ei` for some integer  $i \geq 0$ . Upon construction, `e` has an initial state `e0`. An engine's state may be established via a constructor, a `seed` function, assignment, or a suitable `operator>>`.

`E`'s specification shall define:

- the size of `E`'s state in multiples of the size of `result_type`, given as an integral constant expression;
- the *transition algorithm* `TA` by which `e`'s state `ei` is advanced to its *successor state* `ei+1`; and
- the *generation algorithm* `GA` by which an engine's state is mapped to a value of type `result_type`.

A class **E** that meets the requirements of a uniform random bit generator (28.5.3.3) also meets the requirements of a *random number engine* if the expressions shown in Table 96 are valid and have the indicated semantics, and if **E** also meets all other requirements of 28.5.3.4. In Table 96 and throughout this subclause:

- **T** is the type named by **E**'s associated `result_type`;
- **e** is a value of **E**, **v** is an lvalue of **E**, **x** and **y** are (possibly `const`) values of **E**;
- **s** is a value of **T**;
- **q** is an lvalue meeting the requirements of a seed sequence (28.5.3.2);
- **z** is a value of type `unsigned long long`;
- **os** is an lvalue of the type of some class template specialization `basic_ostream<charT, traits>`; and
- **is** is an lvalue of the type of some class template specialization `basic_istream<charT, traits>`;

where `charT` and `traits` are constrained according to Clause 23 and Clause 31.

Table 96 — Random number engine requirements [tab:rand.req.eng]

| Expression                                   | Return type       | Pre/post-condition                                                                                                                                                                                                                                                                                                                            | Complexity                                                                                 |
|----------------------------------------------|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------|
| <b>E</b> ()                                  |                   | Creates an engine with the same initial state as all other default-constructed engines of type <b>E</b> .                                                                                                                                                                                                                                     | $\mathcal{O}(\text{size of state})$                                                        |
| <b>E</b> ( <b>x</b> )                        |                   | Creates an engine that compares equal to <b>x</b> .                                                                                                                                                                                                                                                                                           | $\mathcal{O}(\text{size of state})$                                                        |
| <b>E</b> ( <b>s</b> )                        |                   | Creates an engine with initial state determined by <b>s</b> .                                                                                                                                                                                                                                                                                 | $\mathcal{O}(\text{size of state})$                                                        |
| <b>E</b> ( <b>q</b> ) <sup>225</sup>         |                   | Creates an engine with an initial state that depends on a sequence produced by one call to <b>q.generate</b> .                                                                                                                                                                                                                                | same as complexity of <b>q.generate</b> called on a sequence whose length is size of state |

| <b>x</b> != <b>y</b>                         | <code>bool</code> | !( <b>x</b> == <b>y</b> ) .                                                                                                                                                                                                                                                                                                                   | $\mathcal{O}(\text{size of state})$                                                        |

225) This constructor (as well as the subsequent corresponding `seed`() function) can be particularly useful to applications requiring a large number of independent random sequences.

226) This operation is common in user code, and can often be implemented in an engine-specific manner so as to provide significant performance improvements over an equivalent naive loop that makes **z** consecutive calls **e**() .

Table 96 — Random number engine requirements (continued)

| Expression                 | Return type                              | Pre/post-condition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Complexity                          |
|----------------------------|------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------|
| <code>os &lt;&lt; x</code> | reference to the type of <code>os</code> | With <code>os.fmtflags</code> set to <code>ios_base::dec   ios_base::left</code> and the fill character set to the space character, writes to <code>os</code> the textual representation of <code>x</code> 's current state. In the output, adjacent numbers are separated by one or more space characters.<br><i>Postconditions:</i> The <code>os.fmtflags</code> and fill character are unchanged.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | $\mathcal{O}(\text{size of state})$ |
| <code>is &gt;&gt; v</code> | reference to the type of <code>is</code> | With <code>is.fmtflags</code> set to <code>ios_base::dec</code> , sets <code>v</code> 's state as determined by reading its textual representation from <code>is</code> . If bad input is encountered, ensures that <code>v</code> 's state is unchanged by the operation and calls <code>is.setstate(ios_base::failbit)</code> (which may throw <code>ios_base::failure</code> (31.5.4.4)). If a textual representation written via <code>os &lt;&lt; x</code> was subsequently read via <code>is &gt;&gt; v</code> , then <code>x == v</code> provided that there have been no intervening invocations of <code>x</code> or of <code>v</code> .<br><i>Preconditions:</i> <code>is</code> provides a textual representation that was previously written using an output stream whose imbued locale was the same as that of <code>is</code> , and whose type's template specialization arguments <code>charT</code> and <code>traits</code> were respectively the same as those of <code>is</code> .<br><i>Postconditions:</i> The <code>is.fmtflags</code> are unchanged. | $\mathcal{O}(\text{size of state})$ |

E shall meet the *Cpp17CopyConstructible* (Table 32) and *Cpp17CopyAssignable* (Table 34) requirements. These operations shall each be of complexity no worse than  $\mathcal{O}(\text{size of state})$ .

### 28.5.3.5 Random number engine adaptor requirements

[rand.req.adapt]

A *random number engine adaptor* (commonly shortened to *adaptor*) `a` of type `A` is a random number engine that takes values produced by some other random number engine, and applies an algorithm to those values in order to deliver a sequence of values with different randomness properties. An engine `b` of type `B` adapted in this way is termed a *base engine* in this context. The expression `a.base()` shall be valid and shall return a const reference to `a`'s base engine.

The requirements of a random number engine type shall be interpreted as follows with respect to a random number engine adaptor type.

`A::A();`

*Effects:* The base engine is initialized as if by its default constructor.

```
bool operator==(const A& a1, const A& a2);
```

*Returns:* `true` if `a1`'s base engine is equal to `a2`'s base engine. Otherwise returns `false`.

```
A::A(result_type s);
```

*Effects:* The base engine is initialized with `s`.

```
template<class Sseq> A::A(Sseq& q);
```

*Effects:* The base engine is initialized with `q`.

```
void seed();
```

*Effects:* With `b` as the base engine, invokes `b.seed()`.

```
void seed(result_type s);
```

*Effects:* With `b` as the base engine, invokes `b.seed(s)`.

```
template<class Sseq> void seed(Sseq& q);
```

*Effects:* With `b` as the base engine, invokes `b.seed(q)`.

**A** shall also meet the following additional requirements:

- The complexity of each function shall not exceed the complexity of the corresponding function applied to the base engine.
- The state of **A** shall include the state of its base engine. The size of **A**'s state shall be no less than the size of the base engine.
- Copying **A**'s state (e.g., during copy construction or copy assignment) shall include copying the state of the base engine of **A**.
- The textual representation of **A** shall include the textual representation of its base engine.

### 28.5.3.6 Random number distribution requirements

[rand.req.dist]

A *random number distribution* (commonly shortened to *distribution*) `d` of type **D** is a function object returning values that are distributed according to an associated mathematical *probability density function*  $p(z)$  or according to an associated *discrete probability function*  $P(z_i)$ . A distribution's specification identifies its associated probability function  $p(z)$  or  $P(z_i)$ .

An associated probability function is typically expressed using certain externally-supplied quantities known as the *parameters of the distribution*. Such distribution parameters are identified in this context by writing, for example,  $p(z | a, b)$  or  $P(z_i | a, b)$ , to name specific parameters, or by writing, for example,  $p(z | \{p\})$  or  $P(z_i | \{p\})$ , to denote a distribution's parameters **p** taken as a whole.

A class **D** meets the requirements of a *random number distribution* if the expressions shown in Table 97 are valid and have the indicated semantics, and if **D** and its associated types also meet all other requirements of 28.5.3.6. In Table 97 and throughout this subclause,

- **T** is the type named by **D**'s associated `result_type`;
- **P** is the type named by **D**'s associated `param_type`;
- `d` is a value of **D**, and `x` and `y` are (possibly `const`) values of **D**;
- `glb` and `lub` are values of **T** respectively corresponding to the greatest lower bound and the least upper bound on the values potentially returned by `d.operator()`, as determined by the current values of `d`'s parameters;
- `p` is a (possibly `const`) value of **P**;
- `g`, `g1`, and `g2` are lvalues of a type meeting the requirements of a uniform random bit generator (28.5.3.3);
- `os` is an lvalue of the type of some class template specialization `basic_ostream<charT, traits>`; and
- `is` is an lvalue of the type of some class template specialization `basic_istream<charT, traits>`;

where `charT` and `traits` are constrained according to Clause 23 and Clause 31.

Table 97 — Random number distribution requirements [tab:rand.req.dist]

| Expression                  | Return type                 | Pre/post-condition                                                                                                                                                                                                                                                                                                                                | Complexity                                    |
|-----------------------------|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------|
| <code>D::result_type</code> | T                           | T is an arithmetic type (6.8.2).                                                                                                                                                                                                                                                                                                                  | compile-time                                  |
| <code>D::param_type</code>  | P                           |                                                                                                                                                                                                                                                                                                                                                   | compile-time                                  |

| <code>D(p)</code>           |                             | Creates a distribution whose behavior is indistinguishable from that of a distribution newly constructed directly from the values used to construct p.                                                                                                                                                                                            | same as p's construction                      |
| <code>d.reset()</code>      | void                        | Subsequent uses of d do not depend on values produced by any engine prior to invoking reset.                                                                                                                                                                                                                                                      | constant                                      |
| <code>x.param()</code>      | P                           | Returns a value p such that <code>D(p).param() == p</code> .                                                                                                                                                                                                                                                                                      | no worse than the complexity of D(p)          |
| <code>d.param(p)</code>     | void                        | <i>Postconditions:</i> <code>d.param() == p</code> .                                                                                                                                                                                                                                                                                              | no worse than the complexity of D(p)          |
| <code>d(g)</code>           | T                           | With <code>p = d.param()</code> , the sequence of numbers returned by successive invocations with the same object g is randomly distributed according to the associated $p(z   \{p\})$ or $P(z_i   \{p\})$ function.                                                                                                                              | amortized constant number of invocations of g |
| <code>d(g,p)</code>         | T                           | The sequence of numbers returned by successive invocations with the same objects g and p is randomly distributed according to the associated $p(z   \{p\})$ or $P(z_i   \{p\})$ function.                                                                                                                                                         | amortized constant number of invocations of g |
| <code>x.min()</code>        | T                           | Returns glb.                                                                                                                                                                                                                                                                                                                                      | constant                                      |
| <code>x.max()</code>        | T                           | Returns lub.                                                                                                                                                                                                                                                                                                                                      | constant                                      |
| <code>x == y</code>         | bool                        | This operator is an equivalence relation. Returns true if <code>x.param() == y.param()</code> and $S_1 = S_2$ , where $S_1$ and $S_2$ are the infinite sequences of values that would be generated, respectively, by repeated future calls to <code>x(g1)</code> and <code>y(g2)</code> whenever <code>g1 == g2</code> . Otherwise returns false. | constant                                      |
| <code>x != y</code>         | bool                        | <code>!(x == y)</code> .                                                                                                                                                                                                                                                                                                                          | same as <code>x == y</code> .                 |
| <code>os &lt;&lt; x</code>  | reference to the type of os | Writes to os a textual representation for the parameters and the additional internal data of x.<br><i>Postconditions:</i> The <code>os.fmtflags</code> and fill character are unchanged.                                                                                                                                                          |                                               |

Table 97 — Random number distribution requirements (continued)

| Expression                 | Return type                              | Pre/post-condition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Complexity |
|----------------------------|------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------|
| <code>is &gt;&gt; d</code> | reference to the type of <code>is</code> | Restores from <code>is</code> the parameters and additional internal data of the lvalue <code>d</code> . If bad input is encountered, ensures that <code>d</code> is unchanged by the operation and calls <code>is.setstate(ios_base::failbit)</code> (which may throw <code>ios_base::failure</code> (31.5.4.4)).<br><i>Preconditions:</i> <code>is</code> provides a textual representation that was previously written using an <code>os</code> whose imbued locale and whose type's template specialization arguments <code>charT</code> and <code>traits</code> were the same as those of <code>is</code> .<br><i>Postconditions:</i> The <code>is.fmtflags</code> are unchanged. |            |

`D` shall meet the *Cpp17CopyConstructible* (Table 32) and *Cpp17CopyAssignable* (Table 34) requirements.

The sequence of numbers produced by repeated invocations of `d(g)` shall be independent of any invocation of `os << d` or of any `const` member function of `D` between any of the invocations of `d(g)`.

If a textual representation is written using `os << x` and that representation is restored into the same or a different object `y` of the same type using `is >> y`, repeated invocations of `y(g)` shall produce the same sequence of numbers as would repeated invocations of `x(g)`.

It is unspecified whether `D::param_type` is declared as a (nested) `class` or via a `typedef`. In 28.5, declarations of `D::param_type` are in the form of `typedefs` for convenience of exposition only.

`P` shall meet the *Cpp17CopyConstructible* (Table 32), *Cpp17CopyAssignable* (Table 34), and *Cpp17EqualityComparable* (Table 28) requirements.

For each of the constructors of `D` taking arguments corresponding to parameters of the distribution, `P` shall have a corresponding constructor subject to the same requirements and taking arguments identical in number, type, and default values. Moreover, for each of the member functions of `D` that return values corresponding to parameters of the distribution, `P` shall have a corresponding member function with the identical name, type, and semantics.

`P` shall have a declaration of the form

```
using distribution_type = D;
```

## 28.5.4 Random number engine class templates

[rand.eng]

### 28.5.4.1 General

[rand.eng.general]

Each type instantiated from a class template specified in 28.5.4 meets the requirements of a random number engine (28.5.3.4) type.

Except where specified otherwise, the complexity of each function specified in 28.5.4 is constant.

Except where specified otherwise, no function described in 28.5.4 throws an exception.

Every function described in 28.5.4 that has a function parameter `q` of type `Sseq&` for a template type parameter named `Sseq` that is different from type `seed_seq` throws what and when the invocation of `q.generate` throws.

Descriptions are provided in 28.5.4 only for engine operations that are not described in 28.5.3.4 or for operations where there is additional semantic information. In particular, declarations for copy constructors, for copy assignment operators, for streaming operators, and for equality and inequality operators are not shown in the synopses.

Each template specified in 28.5.4 requires one or more relationships, involving the value(s) of its non-type template parameter(s), to hold. A program instantiating any of these templates is ill-formed if any such required relationship fails to hold.

For every random number engine and for every random number engine adaptor X defined in 28.5.4 and in 28.5.5:

- if the constructor

```
template<class Sseq> explicit X(Sseq& q);
```

is called with a type Sseq that does not qualify as a seed sequence, then this constructor shall not participate in overload resolution;

- if the member function

```
template<class Sseq> void seed(Sseq& q);
```

is called with a type Sseq that does not qualify as a seed sequence, then this function shall not participate in overload resolution.

The extent to which an implementation determines that a type cannot be a seed sequence is unspecified, except that as a minimum a type shall not qualify as a seed sequence if it is implicitly convertible to `X::result_type`.

#### 28.5.4.2 Class template `linear_congruential_engine`

[rand.eng.lcong]

A `linear_congruential_engine` random number engine produces unsigned integer random numbers. The state  $x_i$  of a `linear_congruential_engine` object `x` is of size 1 and consists of a single integer. The transition algorithm is a modular linear function of the form  $TA(x_i) = (a \cdot x_i + c) \bmod m$ ; the generation algorithm is  $GA(x_i) = x_{i+1}$ .

```
namespace std {
    template<class UIntType, UIntType a, UIntType c, UIntType m>
    class linear_congruential_engine {
    public:
        // types
        using result_type = UIntType;

        // engine characteristics
        static constexpr result_type multiplier = a;
        static constexpr result_type increment = c;
        static constexpr result_type modulus = m;
        static constexpr result_type min() { return c == 0u ? 1u : 0u; }
        static constexpr result_type max() { return m - 1u; }
        static constexpr result_type default_seed = 1u;

        // constructors and seeding functions
        linear_congruential_engine() : linear_congruential_engine(default_seed) {}
        explicit linear_congruential_engine(result_type s);
        template<class Sseq> explicit linear_congruential_engine(Sseq& q);
        void seed(result_type s = default_seed);
        template<class Sseq> void seed(Sseq& q);

        // equality operators
        friend bool operator==(const linear_congruential_engine& x,
                               const linear_congruential_engine& y);

        // generating functions
        result_type operator()();
        void discard(unsigned long long z);

        // inserters and extractors
        template<class charT, class traits>
        friend basic_ostream<charT, traits>&
            operator<<(basic_ostream<charT, traits>& os, const linear_congruential_engine& x);
        template<class charT, class traits>
        friend basic_istream<charT, traits>&
            operator>>(basic_istream<charT, traits>& is, linear_congruential_engine& x);
    };
}
```

```
};
}
```

If the template parameter `m` is 0, the modulus  $m$  used throughout 28.5.4.2 is `numeric_limits<result_type>::max()` plus 1.

NOTE  $m$  need not be representable as a value of type `result_type`.

If the template parameter `m` is not 0, the following relations shall hold:  $a < m$  and  $c < m$ .

The textual representation consists of the value of  $x_i$ .

```
explicit linear_congruential_engine(result_type s);
```

*Effects:* If  $c \bmod m$  is 0 and  $s \bmod m$  is 0, sets the engine's state to 1, otherwise sets the engine's state to  $s \bmod m$ .

```
template<class Sseq> explicit linear_congruential_engine(Sseq& q);
```

*Effects:* With  $k = \left\lceil \frac{\log_2 m}{32} \right\rceil$  and  $a$  an array (or equivalent) of length  $k + 3$ , invokes `q.generate(a + 0, a + k + 3)` and then computes  $S = \left( \sum_{j=0}^{k-1} a_{j+3} \cdot 2^{32j} \right) \bmod m$ . If  $c \bmod m$  is 0 and  $S$  is 0, sets the engine's state to 1, else sets the engine's state to  $S$ .

### 28.5.4.3 Class template `mersenne_twister_engine` [rand.eng.mers]

A `mersenne_twister_engine` random number engine<sup>227</sup> produces unsigned integer random numbers in the closed interval  $[0, 2^w - 1]$ . The state  $x_i$  of a `mersenne_twister_engine` object `x` is of size  $n$  and consists of a sequence  $X$  of  $n$  values of the type delivered by `x`; all subscripts applied to  $X$  are to be taken modulo  $n$ .

The transition algorithm employs a twisted generalized feedback shift register defined by shift values  $n$  and  $m$ , a twist value  $r$ , and a conditional xor-mask  $a$ . To improve the uniformity of the result, the bits of the raw shift register are additionally *tempered* (i.e., scrambled) according to a bit-scrambling matrix defined by values  $u, d, s, b, t, c$ , and  $\ell$ .

The state transition is performed as follows:

- Concatenate the upper  $w - r$  bits of  $X_{i-n}$  with the lower  $r$  bits of  $X_{i+1-n}$  to obtain an unsigned integer value  $Y$ .
- With  $\alpha = a \cdot (Y \text{ bitand } 1)$ , set  $X_i$  to  $X_{i+m-n}$  xor  $(Y \text{ rshift } 1) \text{ xor } \alpha$ .

The sequence  $X$  is initialized with the help of an initialization multiplier  $f$ .

The generation algorithm determines the unsigned integer values  $z_1, z_2, z_3, z_4$  as follows, then delivers  $z_4$  as its result:

- Let  $z_1 = X_i \text{ xor } ((X_i \text{ rshift } u) \text{ bitand } d)$ .
- Let  $z_2 = z_1 \text{ xor } ((z_1 \text{ lshift}_w s) \text{ bitand } b)$ .
- Let  $z_3 = z_2 \text{ xor } ((z_2 \text{ lshift}_w t) \text{ bitand } c)$ .
- Let  $z_4 = z_3 \text{ xor } (z_3 \text{ rshift } \ell)$ .

```
namespace std {
    template<class UIntType, size_t w, size_t n, size_t m, size_t r,
            UIntType a, size_t u, UIntType d, size_t s,
            UIntType b, size_t t,
            UIntType c, size_t l, UIntType f>
    class mersenne_twister_engine {
    public:
        // types
        using result_type = UIntType;

        // engine characteristics
        static constexpr size_t word_size = w;
        static constexpr size_t state_size = n;
        static constexpr size_t shift_size = m;
        static constexpr size_t mask_bits = r;
```

<sup>227</sup> The name of this engine refers, in part, to a property of its period: For properly-selected values of the parameters, the period is closely related to a large Mersenne prime number.

```

static constexpr UIntType xor_mask = a;
static constexpr size_t tempering_u = u;
static constexpr UIntType tempering_d = d;
static constexpr size_t tempering_s = s;
static constexpr UIntType tempering_b = b;
static constexpr size_t tempering_t = t;
static constexpr UIntType tempering_c = c;
static constexpr size_t tempering_l = l;
static constexpr UIntType initialization_multiplier = f;
static constexpr result_type min() { return 0; }
static constexpr result_type max() { return 2w - 1; }
static constexpr result_type default_seed = 5489u;

// constructors and seeding functions
mersenne_twister_engine() : mersenne_twister_engine(default_seed) {}
explicit mersenne_twister_engine(result_type value);
template<class Sseq> explicit mersenne_twister_engine(Sseq& q);
void seed(result_type value = default_seed);
template<class Sseq> void seed(Sseq& q);

// equality operators
friend bool operator==(const mersenne_twister_engine& x, const mersenne_twister_engine& y);

// generating functions
result_type operator()();
void discard(unsigned long long z);

// inserters and extractors
template<class charT, class traits>
friend basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const mersenne_twister_engine& x);
template<class charT, class traits>
friend basic_istream<charT, traits>&
operator>>(basic_istream<charT, traits>& is, mersenne_twister_engine& x);
};
}

```

The following relations shall hold:  $0 < m, m \leq n$ ,  $2u < w$ ,  $r \leq w$ ,  $u \leq w$ ,  $s \leq w$ ,  $t \leq w$ ,  $l \leq w$ ,  $w \leq \text{numeric\_limits}<\text{UIntType}>::\text{digits}$ ,  $a \leq (1u << w) - 1u$ ,  $b \leq (1u << w) - 1u$ ,  $c \leq (1u << w) - 1u$ ,  $d \leq (1u << w) - 1u$ , and  $f \leq (1u << w) - 1u$ .

The textual representation of  $\mathbf{x}_i$  consists of the values of  $X_{i-n}, \dots, X_{i-1}$ , in that order.

```
explicit mersenne_twister_engine(result_type value);
```

*Effects:* Sets  $X_{-n}$  to value mod  $2^w$ . Then, iteratively for  $i = 1 - n, \dots, -1$ , sets  $X_i$  to

$$[f \cdot (X_{i-1} \text{ xor } (X_{i-1} \text{ rshift } (w - 2))) + i \bmod n] \bmod 2^w.$$

*Complexity:*  $\mathcal{O}(n)$ .

```
template<class Sseq> explicit mersenne_twister_engine(Sseq& q);
```

*Effects:* With  $k = \lceil w/32 \rceil$  and  $a$  an array (or equivalent) of length  $n \cdot k$ , invokes  $\mathbf{q}.\text{generate}(a + 0, a + n \cdot k)$  and then, iteratively for  $i = -n, \dots, -1$ , sets  $X_i$  to  $\left(\sum_{j=0}^{k-1} a_{k(i+n)+j} \cdot 2^{32j}\right) \bmod 2^w$ . Finally, if the most significant  $w - r$  bits of  $X_{-n}$  are zero, and if each of the other resulting  $X_i$  is 0, changes  $X_{-n}$  to  $2^{w-1}$ .

#### 28.5.4.4 Class template subtract\_with\_carry\_engine

[rand.eng.sub]

A `subtract_with_carry_engine` random number engine produces unsigned integer random numbers.

The state  $\mathbf{x}_i$  of a `subtract_with_carry_engine` object  $\mathbf{x}$  is of size  $\mathcal{O}(r)$ , and consists of a sequence  $X$  of  $r$  integer values  $0 \leq X_i < m = 2^w$ ; all subscripts applied to  $X$  are to be taken modulo  $r$ . The state  $\mathbf{x}_i$  additionally consists of an integer  $c$  (known as the *carry*) whose value is either 0 or 1.

The state transition is performed as follows:

- Let  $Y = X_{i-s} - X_{i-r} - c$ .
- Set  $X_i$  to  $y = Y \bmod m$ . Set  $c$  to 1 if  $Y < 0$ , otherwise set  $c$  to 0.

NOTE This algorithm corresponds to a modular linear function of the form  $\text{TA}(\mathbf{x}_i) = (a \cdot \mathbf{x}_i) \bmod b$ , where  $b$  is of the form  $m^r - m^s + 1$  and  $a = b - (b - 1)/m$ .

The generation algorithm is given by  $\text{GA}(\mathbf{x}_i) = y$ , where  $y$  is the value produced as a result of advancing the engine's state as described above.

```
namespace std {
    template<class UIntType, size_t w, size_t s, size_t r>
    class subtract_with_carry_engine {
    public:
        // types
        using result_type = UIntType;

        // engine characteristics
        static constexpr size_t word_size = w;
        static constexpr size_t short_lag = s;
        static constexpr size_t long_lag = r;
        static constexpr result_type min() { return 0; }
        static constexpr result_type max() { return m - 1; }
        static constexpr result_type default_seed = 19780503u;

        // constructors and seeding functions
        subtract_with_carry_engine() : subtract_with_carry_engine(default_seed) {}
        explicit subtract_with_carry_engine(result_type value);
        template<class Sseq> explicit subtract_with_carry_engine(Sseq& q);
        void seed(result_type value = default_seed);
        template<class Sseq> void seed(Sseq& q);

        // equality operators
        friend bool operator==(const subtract_with_carry_engine& x,
                               const subtract_with_carry_engine& y);

        // generating functions
        result_type operator()();
        void discard(unsigned long long z);

        // inserters and extractors
        template<class charT, class traits>
        friend basic_ostream<charT, traits>&
            operator<<(basic_ostream<charT, traits>& os, const subtract_with_carry_engine& x);
        template<class charT, class traits>
        friend basic_istream<charT, traits>&
            operator>>(basic_istream<charT, traits>& is, subtract_with_carry_engine& x);
    };
}
```

The following relations shall hold:  $0u < s$ ,  $s < r$ ,  $0 < w$ , and  $w \leq \text{numeric\_limits}<\text{UIntType}>::\text{digits}$ .

The textual representation consists of the values of  $X_{i-r}, \dots, X_{i-1}$ , in that order, followed by  $c$ .

```
explicit subtract_with_carry_engine(result_type value);
```

*Effects:* Sets the values of  $X_{-r}, \dots, X_{-1}$ , in that order, as specified below. If  $X_{-1}$  is then 0, sets  $c$  to 1; otherwise sets  $c$  to 0.

To set the values  $X_k$ , first construct  $e$ , a `linear_congruential_engine` object, as if by the following definition:

```
linear_congruential_engine<result_type,
    40014u, 0u, 2147483563u> e(value == 0u ? default_seed : value);
```

Then, to set each  $X_k$ , obtain new values  $z_0, \dots, z_{n-1}$  from  $n = \lceil w/32 \rceil$  successive invocations of  $e$ . Set  $X_k$  to  $\left( \sum_{j=0}^{n-1} z_j \cdot 2^{32j} \right) \bmod m$ .

*Complexity:* Exactly  $n \cdot r$  invocations of  $e$ .

```
template<class Sseq> explicit subtract_with_carry_engine(Sseq& q);
```

*Effects:* With  $k = \lceil w/32 \rceil$  and  $a$  an array (or equivalent) of length  $r \cdot k$ , invokes  $q.generate(a + 0, a + r \cdot k)$  and then, iteratively for  $i = -r, \dots, -1$ , sets  $X_i$  to  $\left(\sum_{j=0}^{k-1} a_{k(i+r)+j} \cdot 2^{32j}\right) \bmod m$ . If  $X_{-1}$  is then 0, sets  $c$  to 1; otherwise sets  $c$  to 0.

## 28.5.5 Random number engine adaptor class templates

[rand.adapt]

### 28.5.5.1 General

[rand.adapt.general]

Each type instantiated from a class template specified in 28.5.5 meets the requirements of a random number engine adaptor (28.5.3.5) type.

Except where specified otherwise, the complexity of each function specified in 28.5.5 is constant.

Except where specified otherwise, no function described in 28.5.5 throws an exception.

Every function described in 28.5.5 that has a function parameter  $q$  of type  $Sseq\&$  for a template type parameter named  $Sseq$  that is different from type `seed_seq` throws what and when the invocation of  $q.generate$  throws.

Descriptions are provided in 28.5.5 only for adaptor operations that are not described in subclause 28.5.3.5 or for operations where there is additional semantic information. In particular, declarations for copy constructors, for copy assignment operators, for streaming operators, and for equality and inequality operators are not shown in the synopses.

Each template specified in 28.5.5 requires one or more relationships, involving the value(s) of its non-type template parameter(s), to hold. A program instantiating any of these templates is ill-formed if any such required relationship fails to hold.

### 28.5.5.2 Class template `discard_block_engine`

[rand.adapt.disc]

A `discard_block_engine` random number engine adaptor produces random numbers selected from those produced by some base engine  $e$ . The state  $x_i$  of a `discard_block_engine` engine adaptor object  $x$  consists of the state  $e_i$  of its base engine  $e$  and an additional integer  $n$ . The size of the state is the size of  $e$ 's state plus 1.

The transition algorithm discards all but  $r > 0$  values from each block of  $p \geq r$  values delivered by  $e$ . The state transition is performed as follows: If  $n \geq r$ , advance the state of  $e$  from  $e_i$  to  $e_{i+p-r}$  and set  $n$  to 0. In any case, then increment  $n$  and advance  $e$ 's then-current state  $e_j$  to  $e_{j+1}$ .

The generation algorithm yields the value returned by the last invocation of  $e()$  while advancing  $e$ 's state as described above.

```
namespace std {
    template<class Engine, size_t p, size_t r>
    class discard_block_engine {
    public:
        // types
        using result_type = typename Engine::result_type;

        // engine characteristics
        static constexpr size_t block_size = p;
        static constexpr size_t used_block = r;
        static constexpr result_type min() { return Engine::min(); }
        static constexpr result_type max() { return Engine::max(); }

        // constructors and seeding functions
        discard_block_engine();
        explicit discard_block_engine(const Engine& e);
        explicit discard_block_engine(Engine&& e);
        explicit discard_block_engine(result_type s);
        template<class Sseq> explicit discard_block_engine(Sseq& q);
        void seed();
        void seed(result_type s);
        template<class Sseq> void seed(Sseq& q);

        // equality operators
        friend bool operator==(const discard_block_engine& x, const discard_block_engine& y);
```

```

// generating functions
result_type operator()();
void discard(unsigned long long z);

// property functions
const Engine& base() const noexcept { return e; }

// inserters and extractors
template<class charT, class traits>
friend basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const discard_block_engine& x);
template<class charT, class traits>
friend basic_istream<charT, traits>&
operator>>(basic_istream<charT, traits>& is, discard_block_engine& x);

private:
    Engine e;    // exposition only
    size_t n;    // exposition only
};
}

```

The following relations shall hold:  $0 < r$  and  $r \leq p$ .

The textual representation consists of the textual representation of **e** followed by the value of **n**.

In addition to its behavior pursuant to subclause 28.5.3.5, each constructor that is not a copy constructor sets **n** to 0.

### 28.5.5.3 Class template independent\_bits\_engine [rand.adapt.ibits]

An **independent\_bits\_engine** random number engine adaptor combines random numbers that are produced by some base engine *e*, so as to produce random numbers with a specified number of bits *w*. The state  $x_i$  of an **independent\_bits\_engine** engine adaptor object **x** consists of the state  $e_i$  of its base engine **e**; the size of the state is the size of *e*'s state.

The transition and generation algorithms are described in terms of the following integral constants:

- Let  $R = e.max() - e.min() + 1$  and  $m = \lfloor \log_2 R \rfloor$ .
- With *n* as determined below, let  $w_0 = \lfloor w/n \rfloor$ ,  $n_0 = n - w \bmod n$ ,  $y_0 = 2^{w_0} \lfloor R/2^{w_0} \rfloor$ , and  $y_1 = 2^{w_0+1} \lfloor R/2^{w_0+1} \rfloor$ .
- Let  $n = \lceil w/m \rceil$  if and only if the relation  $R - y_0 \leq \lfloor y_0/n \rfloor$  holds as a result. Otherwise let  $n = 1 + \lceil w/m \rceil$ .

NOTE The relation  $w = n_0 w_0 + (n - n_0)(w_0 + 1)$  always holds.

The transition algorithm is carried out by invoking **e()** as often as needed to obtain  $n_0$  values less than  $y_0 + e.min()$  and  $n - n_0$  values less than  $y_1 + e.min()$ .

The generation algorithm uses the values produced while advancing the state as described above to yield a quantity *S* obtained as if by the following algorithm:

```

S = 0;
for (k = 0; k < n_0; k += 1) {
    do u = e() - e.min(); while (u >= y_0);
    S = 2^{w_0} * S + u mod 2^{w_0};
}
for (k = n_0; k < n; k += 1) {
    do u = e() - e.min(); while (u >= y_1);
    S = 2^{w_0+1} * S + u mod 2^{w_0+1};
}

template<class Engine, size_t w, class UIntType>
class independent_bits_engine {
public:
    // types
    using result_type = UIntType;

    // engine characteristics
    static constexpr result_type min() { return 0; }

```

```

static constexpr result_type max() { return 2w - 1; }

// constructors and seeding functions
independent_bits_engine();
explicit independent_bits_engine(const Engine& e);
explicit independent_bits_engine(Engine&& e);
explicit independent_bits_engine(result_type s);
template<class Sseq> explicit independent_bits_engine(Sseq& q);
void seed();
void seed(result_type s);
template<class Sseq> void seed(Sseq& q);

// equality operators
friend bool operator==(const independent_bits_engine& x, const independent_bits_engine& y);

// generating functions
result_type operator()();
void discard(unsigned long long z);

// property functions
const Engine& base() const noexcept { return e; }

// inserters and extractors
template<class charT, class traits>
friend basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const independent_bits_engine& x);
template<class charT, class traits>
friend basic_istream<charT, traits>&
operator>>(basic_istream<charT, traits>& is, independent_bits_engine& x);

private:
    Engine e;    // exposition only
};

```

The following relations shall hold:  $0 < w$  and  $w \leq \text{numeric\_limits}<\text{result\_type}>::\text{digits}$ .

The textual representation consists of the textual representation of  $e$ .

#### 28.5.5.4 Class template `shuffle_order_engine` [rand.adapt.shuf]

A `shuffle_order_engine` random number engine adaptor produces the same random numbers that are produced by some base engine  $e$ , but delivers them in a different sequence. The state  $x_i$  of a `shuffle_order_engine` engine adaptor object  $x$  consists of the state  $e_i$  of its base engine  $e$ , an additional value  $Y$  of the type delivered by  $e$ , and an additional sequence  $V$  of  $k$  values also of the type delivered by  $e$ . The size of the state is the size of  $e$ 's state plus  $k + 1$ .

The transition algorithm permutes the values produced by  $e$ . The state transition is performed as follows:

- Calculate an integer  $j = \left\lfloor \frac{k \cdot (Y - e_{\min})}{e_{\max} - e_{\min} + 1} \right\rfloor$ .
- Set  $Y$  to  $V_j$  and then set  $V_j$  to  $e()$ .

The generation algorithm yields the last value of  $Y$  produced while advancing  $e$ 's state as described above.

```

namespace std {
    template<class Engine, size_t k>
    class shuffle_order_engine {
    public:
        // types
        using result_type = typename Engine::result_type;

        // engine characteristics
        static constexpr size_t table_size = k;
        static constexpr result_type min() { return Engine::min(); }
        static constexpr result_type max() { return Engine::max(); }
    };

```

```

// constructors and seeding functions
shuffle_order_engine();
explicit shuffle_order_engine(const Engine& e);
explicit shuffle_order_engine(Engine&& e);
explicit shuffle_order_engine(result_type s);
template<class Sseq> explicit shuffle_order_engine(Sseq& q);
void seed();
void seed(result_type s);
template<class Sseq> void seed(Sseq& q);

// equality operators
friend bool operator==(const shuffle_order_engine& x, const shuffle_order_engine& y);

// generating functions
result_type operator()();
void discard(unsigned long long z);

// property functions
const Engine& base() const noexcept { return e; }

// inserters and extractors
template<class charT, class traits>
    friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const shuffle_order_engine& x);
template<class charT, class traits>
    friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is, shuffle_order_engine& x);

private:
    Engine e;           // exposition only
    result_type V[k];    // exposition only
    result_type Y;       // exposition only
};
}

```

The following relation shall hold:  $0 < k$ .

The textual representation consists of the textual representation of **e**, followed by the **k** values of **V**, followed by the value of **Y**.

In addition to its behavior pursuant to subclause 28.5.3.5, each constructor that is not a copy constructor initializes **V**[0], ..., **V**[**k**-1] and **Y**, in that order, with values returned by successive invocations of **e**().

### 28.5.6 Engines and engine adaptors with predefined parameters [rand.predef]

```
using minstd_rand0 =
    linear_congruential_engine<uint_fast32_t, 16'807, 0, 2'147'483'647>;
```

*Required behavior:* The 10000<sup>th</sup> consecutive invocation of a default-constructed object of type **minstd\_rand0** produces the value 1043618065.

```
using minstd_rand =
    linear_congruential_engine<uint_fast32_t, 48'271, 0, 2'147'483'647>;
```

*Required behavior:* The 10000<sup>th</sup> consecutive invocation of a default-constructed object of type **minstd\_rand** produces the value 399268537.

```
using mt19937 =
    mersenne_twister_engine<uint_fast32_t, 32, 624, 397, 31,
        0x9908'b0df, 11, 0xffff'ffff, 7, 0x9d2c'5680, 15, 0xefc6'0000, 18, 1'812'433'253>;
```

*Required behavior:* The 10000<sup>th</sup> consecutive invocation of a default-constructed object of type **mt19937** produces the value 4123659995.

```
using mt19937_64 =
    mersenne_twister_engine<uint_fast64_t, 64, 312, 156, 31,
        0xb502'6f5a'a966'19e9, 29, 0x5555'5555'5555'5555, 17,
        0x71d6'7fff'eda6'0000, 37, 0xffff'7'eee0'0000'0000, 43, 6'364'136'223'846'793'005>;
```

*Required behavior:* The 10000<sup>th</sup> consecutive invocation of a default-constructed object of type `mt19937_64` produces the value 9981545732273789042.

```
using ranlux24_base =
    subtract_with_carry_engine<uint_fast32_t, 24, 10, 24>;
```

*Required behavior:* The 10000<sup>th</sup> consecutive invocation of a default-constructed object of type `ranlux24_base` produces the value 7937952.

```
using ranlux48_base =
    subtract_with_carry_engine<uint_fast64_t, 48, 5, 12>;
```

*Required behavior:* The 10000<sup>th</sup> consecutive invocation of a default-constructed object of type `ranlux48_base` produces the value 61839128582725.

```
using ranlux24 = discard_block_engine<ranlux24_base, 223, 23>;
```

*Required behavior:* The 10000<sup>th</sup> consecutive invocation of a default-constructed object of type `ranlux24` produces the value 9901578.

```
using ranlux48 = discard_block_engine<ranlux48_base, 389, 11>;
```

*Required behavior:* The 10000<sup>th</sup> consecutive invocation of a default-constructed object of type `ranlux48` produces the value 249142670248501.

```
using knuth_b = shuffle_order_engine<minstd_rand0, 256>;
```

*Required behavior:* The 10000<sup>th</sup> consecutive invocation of a default-constructed object of type `knuth_b` produces the value 1112339016.

```
using default_random_engine = implementation-defined;
```

*Remarks:* The choice of engine type named by this `typedef` is implementation-defined.

NOTE The implementation can select this type on the basis of performance, size, quality, or any combination of such factors, so as to provide at least acceptable engine behavior for relatively casual, inexperienced, and/or lightweight use. Because different implementations can select different underlying engine types, code that uses this `typedef` need not generate identical sequences across implementations.

### 28.5.7 Class `random_device` [rand.device]

A `random_device` uniform random bit generator produces nondeterministic random numbers.

If implementation limitations prevent generating nondeterministic random numbers, the implementation may employ a random number engine.

```
namespace std {
    class random_device {
    public:
        // types
        using result_type = unsigned int;

        // generator characteristics
        static constexpr result_type min() { return numeric_limits<result_type>::min(); }
        static constexpr result_type max() { return numeric_limits<result_type>::max(); }

        // constructors
        random_device() : random_device(implementation-defined) {}
        explicit random_device(const string& token);

        // generating functions
        result_type operator()();

        // property functions
        double entropy() const noexcept;
```

```

    // no copy functions
    random_device(const random_device&) = delete;
    void operator=(const random_device&) = delete;
};
}

```

```
explicit random_device(const string& token);
```

*Throws:* A value of an implementation-defined type derived from `exception` if the `random_device` cannot be initialized.

*Remarks:* The semantics of the `token` parameter and the token value used by the default constructor are implementation-defined.<sup>228</sup>

```
double entropy() const noexcept;
```

*Returns:* If the implementation employs a random number engine, returns 0.0. Otherwise, returns an entropy estimate<sup>229</sup> for the random numbers returned by `operator()`, in the range `min()` to `log2(max() + 1)`.

```
result_type operator()();
```

*Returns:* A nondeterministic random value, uniformly distributed between `min()` and `max()` (inclusive). It is implementation-defined how these values are generated.

*Throws:* A value of an implementation-defined type derived from `exception` if a random number cannot be obtained.

## 28.5.8 Utilities

[rand.util]

### 28.5.8.1 Class `seed_seq`

[rand.util.seedseq]

```

namespace std {
    class seed_seq {
    public:
        // types
        using result_type = uint_least32_t;

        // constructors
        seed_seq() noexcept;
        template<class T>
            seed_seq(initializer_list<T> il);
        template<class InputIterator>
            seed_seq(InputIterator begin, InputIterator end);

        // generating functions
        template<class RandomAccessIterator>
            void generate(RandomAccessIterator begin, RandomAccessIterator end);

        // property functions
        size_t size() const noexcept;
        template<class OutputIterator>
            void param(OutputIterator dest) const;

        // no copy functions
        seed_seq(const seed_seq&) = delete;
        void operator=(const seed_seq&) = delete;

    private:
        vector<result_type> v;    // exposition only
    };
}

```

228) The parameter is intended to allow an implementation to differentiate between different sources of randomness.

229) If a device has  $n$  states whose respective probabilities are  $P_0, \dots, P_{n-1}$ , the device entropy  $S$  is defined as

$$S = - \sum_{i=0}^{n-1} P_i \cdot \log P_i.$$

`seed_seq()` noexcept;

*Postconditions:* `v.empty()` is true.

template<class T>

`seed_seq(initializer_list<T> il);`

*Constraints:* T is an integer type.

*Effects:* Same as `seed_seq(il.begin(), il.end())`.

template<class InputIterator>

`seed_seq(InputIterator begin, InputIterator end);`

*Mandates:* `iterator_traits<InputIterator>::value_type` is an integer type.

*Preconditions:* `InputIterator` meets the *Cpp17InputIterator* requirements (25.3.5.3).

*Effects:* Initializes `v` by the following algorithm:

```
for (InputIterator s = begin; s != end; ++s)
    v.push_back((*s) mod 232);
```

template<class RandomAccessIterator>

`void generate(RandomAccessIterator begin, RandomAccessIterator end);`

*Mandates:* `iterator_traits<RandomAccessIterator>::value_type` is an unsigned integer type capable of accommodating 32-bit quantities.

*Preconditions:* `RandomAccessIterator` meets the *Cpp17RandomAccessIterator* requirements (25.3.5.7) and the requirements of a mutable iterator.

*Effects:* Does nothing if `begin == end`. Otherwise, with  $s = v.size()$  and  $n = end - begin$ , fills the supplied range `[begin, end)` according to the following algorithm in which each operation is to be carried out modulo  $2^{32}$ , each indexing operator applied to `begin` is to be taken modulo  $n$ , and  $T(x)$  is defined as  $x \text{ xor } (x \text{ rshift } 27)$ :

- By way of initialization, set each element of the range to the value `0x8b8b8b8b`. Additionally, for use in subsequent steps, let  $p = (n - t)/2$  and let  $q = p + t$ , where

$$t = (n \geq 623) ? 11 : (n \geq 68) ? 7 : (n \geq 39) ? 5 : (n \geq 7) ? 3 : (n - 1)/2;$$

- With  $m$  as the larger of  $s + 1$  and  $n$ , transform the elements of the range: iteratively for  $k = 0, \dots, m - 1$ , calculate values

$$\begin{aligned} r_1 &= 1664525 \cdot T(\text{begin}[k] \text{ xor } \text{begin}[k + p] \text{ xor } \text{begin}[k - 1]) \\ r_2 &= r_1 + \begin{cases} s & , k = 0 \\ k \bmod n + v[k - 1] & , 0 < k \leq s \\ k \bmod n & , s < k \end{cases} \end{aligned}$$

and, in order, increment `begin[k + p]` by  $r_1$ , increment `begin[k + q]` by  $r_2$ , and set `begin[k]` to  $r_2$ .

- Transform the elements of the range again, beginning where the previous step ended: iteratively for  $k = m, \dots, m + n - 1$ , calculate values

$$\begin{aligned} r_3 &= 1566083941 \cdot T(\text{begin}[k] + \text{begin}[k + p] + \text{begin}[k - 1]) \\ r_4 &= r_3 - (k \bmod n) \end{aligned}$$

and, in order, update `begin[k + p]` by xoring it with  $r_3$ , update `begin[k + q]` by xoring it with  $r_4$ , and set `begin[k]` to  $r_4$ .

*Throws:* What and when `RandomAccessIterator` operations of `begin` and `end` throw.

`size_t size()` const noexcept;

*Returns:* The number of 32-bit units that would be returned by a call to `param()`.

*Complexity:* Constant time.

```
template<class OutputIterator>
```

```
void param(OutputIterator dest) const;
```

*Mandates:* Values of type `result_type` are writable (25.3.1) to `dest`.

*Preconditions:* `OutputIterator` meets the *Cpp17OutputIterator* requirements (25.3.5.4).

*Effects:* Copies the sequence of prepared 32-bit units to the given destination, as if by executing the following statement:

```
copy(v.begin(), v.end(), dest);
```

*Throws:* What and when `OutputIterator` operations of `dest` throw.

## 28.5.8.2 Function template `generate_canonical`

[rand.util.canonical]

```
template<class RealType, size_t bits, class URBG>
```

```
RealType generate_canonical(URBG& g);
```

*Effects:* Invokes `g()`  $k$  times to obtain values  $g_0, \dots, g_{k-1}$ , respectively. Calculates a quantity  $S$  given by Formula 28.1 using arithmetic of type `RealType`:

$$S = \sum_{i=0}^{k-1} (g_i - g.\text{min}()) \cdot R^i \quad (28.1)$$

*Returns:*  $S/R^k$ .

NOTE 1  $0 \leq S/R^k < 1$ .

*Throws:* What and when `g` throws.

*Complexity:* Exactly  $k = \max(1, \lceil b/\log_2 R \rceil)$  invocations of `g`, where  $b^{230}$  is the lesser of `numeric_limits<RealType>::digits` and `bits`, and  $R$  is the value of `g.max() - g.min() + 1`.

NOTE 2 If the values  $g_i$  produced by `g` are uniformly distributed, the instantiation's results are distributed as uniformly as possible. Obtaining a value in this way can be a useful step in the process of transforming a value generated by a uniform random bit generator into a value that can be delivered by a random number distribution.

## 28.5.9 Random number distribution class templates

[rand.dist]

### 28.5.9.1 General

[rand.dist.general]

Each type instantiated from a class template specified in 28.5.9 meets the requirements of a random number distribution (28.5.3.6) type.

Descriptions are provided in 28.5.9 only for distribution operations that are not described in 28.5.3.6 or for operations where there is additional semantic information. In particular, declarations for copy constructors, for copy assignment operators, for streaming operators, and for equality and inequality operators are not shown in the synopses.

The algorithms for producing each of the specified distributions are implementation-defined.

The value of each probability density function  $p(z)$  and of each discrete probability function  $P(z_i)$  specified in this subclause is 0 everywhere outside its stated domain.

### 28.5.9.2 Uniform distributions

[rand.dist.uni]

#### 28.5.9.2.1 Class template `uniform_int_distribution`

[rand.dist.uni.int]

A `uniform_int_distribution` random number distribution produces random integers  $i$ ,  $a \leq i \leq b$ , distributed according to the constant discrete probability function in Formula 28.2.

$$P(i | a, b) = 1/(b - a + 1) \quad (28.2)$$

```
namespace std {
    template<class IntType = int>
    class uniform_int_distribution {
    public:
        // types
        using result_type = IntType;
```

230)  $b$  is introduced to avoid any attempt to produce more bits of randomness than can be held in `RealType`.

```

using param_type = unspecified;

// constructors and reset functions
uniform_int_distribution() : uniform_int_distribution(0) {}
explicit uniform_int_distribution(IntType a, IntType b = numeric_limits<IntType>::max());
explicit uniform_int_distribution(const param_type& parm);
void reset();

// equality operators
friend bool operator==(const uniform_int_distribution& x, const uniform_int_distribution& y);

// generating functions
template<class URBG>
    result_type operator()(URBG& g);
template<class URBG>
    result_type operator()(URBG& g, const param_type& parm);

// property functions
result_type a() const;
result_type b() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;

// inserters and extractors
template<class charT, class traits>
    friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const uniform_int_distribution& x);
template<class charT, class traits>
    friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is, uniform_int_distribution& x);
};
}

```

```
explicit uniform_int_distribution(IntType a, IntType b = numeric_limits<IntType>::max());
```

*Preconditions:*  $a \leq b$ .

*Remarks:*  $a$  and  $b$  correspond to the respective parameters of the distribution.

```
result_type a() const;
```

*Returns:* The value of the  $a$  parameter with which the object was constructed.

```
result_type b() const;
```

*Returns:* The value of the  $b$  parameter with which the object was constructed.

#### 28.5.9.2.2 Class template `uniform_real_distribution` [rand.dist.uni.real]

A `uniform_real_distribution` random number distribution produces random numbers  $x$ ,  $a \leq x < b$ , distributed according to the constant probability density function in Formula 28.3.

$$p(x | a, b) = 1/(b - a) \quad (28.3)$$

NOTE This implies that  $p(x | a, b)$  is undefined when  $a == b$ .

```

namespace std {
    template<class RealType = double>
        class uniform_real_distribution {
        public:
            // types
            using result_type = RealType;
            using param_type = unspecified;

```

```

// constructors and reset functions
uniform_real_distribution() : uniform_real_distribution(0.0) {}
explicit uniform_real_distribution(RealType a, RealType b = 1.0);
explicit uniform_real_distribution(const param_type& parm);
void reset();

// equality operators
friend bool operator==(const uniform_real_distribution& x,
                       const uniform_real_distribution& y);

// generating functions
template<class URBG>
    result_type operator()(URBG& g);
template<class URBG>
    result_type operator()(URBG& g, const param_type& parm);

// property functions
result_type a() const;
result_type b() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;

// inserters and extractors
template<class charT, class traits>
    friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const uniform_real_distribution& x);
template<class charT, class traits>
    friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is, uniform_real_distribution& x);
};
}

explicit uniform_real_distribution(RealType a, RealType b = 1.0);
    Preconditions:  $a \leq b$  and  $b - a \leq \text{numeric\_limits}<\text{RealType}>::\text{max}()$ .
    Remarks:  $a$  and  $b$  correspond to the respective parameters of the distribution.

result_type a() const;
    Returns: The value of the  $a$  parameter with which the object was constructed.

result_type b() const;
    Returns: The value of the  $b$  parameter with which the object was constructed.

```

### 28.5.9.3 Bernoulli distributions

[rand.dist.bern]

#### 28.5.9.3.1 Class bernoulli\_distribution

[rand.dist.bern.bernoulli]

A `bernoulli` distribution random number distribution produces `bool` values  $b$  distributed according to the discrete probability function in Formula 28.4.

$$P(b|p) = \begin{cases} p & \text{if } b = \text{true} \\ 1 - p & \text{if } b = \text{false} \end{cases} \quad (28.4)$$

```

namespace std {
    class bernoulli_distribution {
    public:
        // types
        using result_type = bool;
        using param_type = unspecified;

        // constructors and reset functions
        bernoulli_distribution() : bernoulli_distribution(0.5) {}
        explicit bernoulli_distribution(double p);
    };
}

```

```

explicit bernoulli_distribution(const param_type& parm);
void reset();

// equality operators
friend bool operator==(const bernoulli_distribution& x, const bernoulli_distribution& y);

// generating functions
template<class URBG>
    result_type operator()(URBG& g);
template<class URBG>
    result_type operator()(URBG& g, const param_type& parm);

// property functions
double p() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;

// inserters and extractors
template<class charT, class traits>
    friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const bernoulli_distribution& x);
template<class charT, class traits>
    friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is, bernoulli_distribution& x);
};
}

explicit bernoulli_distribution(double p);

```

*Preconditions:*  $0 \leq p \leq 1$ .

*Remarks:*  $p$  corresponds to the parameter of the distribution.

`double p() const;`

*Returns:* The value of the  $p$  parameter with which the object was constructed.

### 28.5.9.3.2 Class template binomial distribution [rand.dist.bern.bin]

A `binomial_distribution` random number distribution produces integer values  $i \geq 0$  distributed according to the discrete probability function in Formula 28.5.

$$P(i | t, p) = \binom{t}{i} \cdot p^i \cdot (1 - p)^{t-i} \quad (28.5)$$

```

namespace std {
    template<class IntType = int>
    class binomial_distribution {
    public:
        // types
        using result_type = IntType;
        using param_type = unspecified;

        // constructors and reset functions
        binomial_distribution() : binomial_distribution(1) {}
        explicit binomial_distribution(IntType t, double p = 0.5);
        explicit binomial_distribution(const param_type& parm);
        void reset();

        // equality operators
        friend bool operator==(const binomial_distribution& x, const binomial_distribution& y);
    };
}

```

```

// generating functions
template<class URBG>
    result_type operator()(URBG& g);
template<class URBG>
    result_type operator()(URBG& g, const param_type& parm);

// property functions
IntType t() const;
double p() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;

// inserters and extractors
template<class charT, class traits>
    friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const binomial_distribution& x);
template<class charT, class traits>
    friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is, binomial_distribution& x);
};
}

explicit binomial_distribution(IntType t, double p = 0.5);
    Preconditions:  $0 \leq p \leq 1$  and  $0 \leq t$ .
    Remarks: t and p correspond to the respective parameters of the distribution.

IntType t() const;
    Returns: The value of the t parameter with which the object was constructed.

double p() const;
    Returns: The value of the p parameter with which the object was constructed.

```

### 28.5.9.3.3 Class template `geometric_distribution` [rand.dist.bern.geo]

A `geometric_distribution` random number distribution produces integer values  $i \geq 0$  distributed according to the discrete probability function in Formula 28.6.

$$P(i | p) = p \cdot (1 - p)^i \quad (28.6)$$

```

namespace std {
    template<class IntType = int>
    class geometric_distribution {
    public:
        // types
        using result_type = IntType;
        using param_type = unspecified;

        // constructors and reset functions
        geometric_distribution() : geometric_distribution(0.5) {}
        explicit geometric_distribution(double p);
        explicit geometric_distribution(const param_type& parm);
        void reset();

        // equality operators
        friend bool operator==(const geometric_distribution& x, const geometric_distribution& y);

        // generating functions
        template<class URBG>
            result_type operator()(URBG& g);
        template<class URBG>
            result_type operator()(URBG& g, const param_type& parm);
    };
}

```

```

// property functions
double p() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;

// inserters and extractors
template<class charT, class traits>
    friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const geometric_distribution& x);
template<class charT, class traits>
    friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is, geometric_distribution& x);
};
}

explicit geometric_distribution(double p);

```

*Preconditions:*  $0 < p < 1$ .

*Remarks:*  $p$  corresponds to the parameter of the distribution.

```
double p() const;
```

*Returns:* The value of the  $p$  parameter with which the object was constructed.

#### 28.5.9.3.4 Class template `negative_binomial_distribution` [rand.dist.bern.negbin]

A `negative_binomial_distribution` random number distribution produces random integers  $i \geq 0$  distributed according to the discrete probability function in Formula 28.7.

$$P(i | k, p) = \binom{k+i-1}{i} \cdot p^k \cdot (1-p)^i \quad (28.7)$$

NOTE This implies that  $P(i | k, p)$  is undefined when  $p = 1$ .

```

namespace std {
    template<class IntType = int>
    class negative_binomial_distribution {
    public:
        // types
        using result_type = IntType;
        using param_type = unspecified;

        // constructor and reset functions
        negative_binomial_distribution() : negative_binomial_distribution(1) {}
        explicit negative_binomial_distribution(IntType k, double p = 0.5);
        explicit negative_binomial_distribution(const param_type& parm);
        void reset();

        // equality operators
        friend bool operator==(const negative_binomial_distribution& x,
                               const negative_binomial_distribution& y);

        // generating functions
        template<class URBG>
            result_type operator()(URBG& g);
        template<class URBG>
            result_type operator()(URBG& g, const param_type& parm);

        // property functions
        IntType k() const;
        double p() const;
        param_type param() const;
        void param(const param_type& parm);
        result_type min() const;
        result_type max() const;
    };
}

```

```

// inserters and extractors
template<class charT, class traits>
    friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const negative_binomial_distribution& x);
template<class charT, class traits>
    friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is, negative_binomial_distribution& x);
};
}

explicit negative_binomial_distribution(IntType k, double p = 0.5);

```

*Preconditions:*  $0 < p \leq 1$  and  $0 < k$ .

*Remarks:*  $k$  and  $p$  correspond to the respective parameters of the distribution.

IntType k() const;

*Returns:* The value of the  $k$  parameter with which the object was constructed.

double p() const;

*Returns:* The value of the  $p$  parameter with which the object was constructed.

#### 28.5.9.4 Poisson distributions

[rand.dist.pois]

##### 28.5.9.4.1 Class template poisson\_distribution

[rand.dist.pois.poisson]

A `poisson_distribution` random number distribution produces integer values  $i \geq 0$  distributed according to the discrete probability function in Formula 28.8.

$$P(i|\mu) = \frac{e^{-\mu} \mu^i}{i!} \quad (28.8)$$

The distribution parameter  $\mu$  is also known as this distribution's *mean*.

```

template<class IntType = int>
class poisson_distribution
{
public:
    // types
    using result_type = IntType;
    using param_type = unspecified;

    // constructors and reset functions
    poisson_distribution() : poisson_distribution(1.0) {}
    explicit poisson_distribution(double mean);
    explicit poisson_distribution(const param_type& parm);
    void reset();

    // equality operators
    friend bool operator==(const poisson_distribution& x, const poisson_distribution& y);

    // generating functions
    template<class URBG>
        result_type operator()(URBG& g);
    template<class URBG>
        result_type operator()(URBG& g, const param_type& parm);

    // property functions
    double mean() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;

    // inserters and extractors
    template<class charT, class traits>
        friend basic_ostream<charT, traits>&
            operator<<(basic_ostream<charT, traits>& os, const poisson_distribution& x);

```

```
template<class charT, class traits>
    friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is, poisson_distribution& x);
};
```

```
explicit poisson_distribution(double mean);
```

*Preconditions:*  $0 < \text{mean}$ .

*Remarks:* `mean` corresponds to the parameter of the distribution.

```
double mean() const;
```

*Returns:* The value of the `mean` parameter with which the object was constructed.

#### 28.5.9.4.2 Class template `exponential_distribution` [rand.dist.pois.exp]

An `exponential_distribution` random number distribution produces random numbers  $x > 0$  distributed according to the probability density function in Formula 28.9.

$$p(x | \lambda) = \lambda e^{-\lambda x} \quad (28.9)$$

```
namespace std {
    template<class RealType = double>
    class exponential_distribution {
    public:
        // types
        using result_type = RealType;
        using param_type = unspecified;

        // constructors and reset functions
        exponential_distribution() : exponential_distribution(1.0) {}
        explicit exponential_distribution(RealType lambda);
        explicit exponential_distribution(const param_type& parm);
        void reset();

        // equality operators
        friend bool operator==(const exponential_distribution& x, const exponential_distribution& y);

        // generating functions
        template<class URBG>
            result_type operator()(URBG& g);
        template<class URBG>
            result_type operator()(URBG& g, const param_type& parm);

        // property functions
        RealType lambda() const;
        param_type param() const;
        void param(const param_type& parm);
        result_type min() const;
        result_type max() const;

        // inserters and extractors
        template<class charT, class traits>
            friend basic_ostream<charT, traits>&
                operator<<(basic_ostream<charT, traits>& os, const exponential_distribution& x);
        template<class charT, class traits>
            friend basic_istream<charT, traits>&
                operator>>(basic_istream<charT, traits>& is, exponential_distribution& x);
    };
}
```

```
explicit exponential_distribution(RealType lambda);
```

*Preconditions:*  $0 < \text{lambda}$ .

*Remarks:* `lambda` corresponds to the parameter of the distribution.

RealType lambda() const;

*Returns:* The value of the lambda parameter with which the object was constructed.

#### 28.5.9.4.3 Class template gamma\_distribution [rand.dist.pois.gamma]

A gamma\_distribution random number distribution produces random numbers  $x > 0$  distributed according to the probability density function in Formula 28.10.

$$p(x | \alpha, \beta) = \frac{e^{-x/\beta}}{\beta^\alpha \cdot \Gamma(\alpha)} \cdot x^{\alpha-1} \quad (28.10)$$

```
namespace std {
    template<class RealType = double>
    class gamma_distribution {
    public:
        // types
        using result_type = RealType;
        using param_type = unspecified;

        // constructors and reset functions
        gamma_distribution() : gamma_distribution(1.0) {}
        explicit gamma_distribution(RealType alpha, RealType beta = 1.0);
        explicit gamma_distribution(const param_type& parm);
        void reset();

        // equality operators
        friend bool operator==(const gamma_distribution& x, const gamma_distribution& y);

        // generating functions
        template<class URBG>
            result_type operator()(URBG& g);
        template<class URBG>
            result_type operator()(URBG& g, const param_type& parm);

        // property functions
        RealType alpha() const;
        RealType beta() const;
        param_type param() const;
        void param(const param_type& parm);
        result_type min() const;
        result_type max() const;

        // inserters and extractors
        template<class charT, class traits>
            friend basic_ostream<charT, traits>&
                operator<<(basic_ostream<charT, traits>& os, const gamma_distribution& x);
        template<class charT, class traits>
            friend basic_istream<charT, traits>&
                operator>>(basic_istream<charT, traits>& is, gamma_distribution& x);
    };
}
```

explicit gamma\_distribution(RealType alpha, RealType beta = 1.0);

*Preconditions:*  $0 < \alpha$  and  $0 < \beta$ .

*Remarks:* alpha and beta correspond to the parameters of the distribution.

RealType alpha() const;

*Returns:* The value of the alpha parameter with which the object was constructed.

RealType beta() const;

*Returns:* The value of the beta parameter with which the object was constructed.

28.5.9.4.4 Class template `weibull_distribution`

[rand.dist.pois.weibull]

A `weibull_distribution` random number distribution produces random numbers  $x \geq 0$  distributed according to the probability density function in Formula 28.11.

$$p(x | a, b) = \frac{a}{b} \cdot \left(\frac{x}{b}\right)^{a-1} \cdot \exp\left(-\left(\frac{x}{b}\right)^a\right) \quad (28.11)$$

```
namespace std {
    template<class RealType = double>
    class weibull_distribution {
    public:
        // types
        using result_type = RealType;
        using param_type = unspecified;

        // constructor and reset functions
        weibull_distribution() : weibull_distribution(1.0) {}
        explicit weibull_distribution(RealType a, RealType b = 1.0);
        explicit weibull_distribution(const param_type& parm);
        void reset();

        // equality operators
        friend bool operator==(const weibull_distribution& x, const weibull_distribution& y);

        // generating functions
        template<class URBG>
            result_type operator()(URBG& g);
        template<class URBG>
            result_type operator()(URBG& g, const param_type& parm);

        // property functions
        RealType a() const;
        RealType b() const;
        param_type param() const;
        void param(const param_type& parm);
        result_type min() const;
        result_type max() const;

        // inserters and extractors
        template<class charT, class traits>
            friend basic_ostream<charT, traits>&
                operator<<(basic_ostream<charT, traits>& os, const weibull_distribution& x);
        template<class charT, class traits>
            friend basic_istream<charT, traits>&
                operator>>(basic_istream<charT, traits>& is, weibull_distribution& x);
    };
}
```

explicit weibull\_distribution(RealType a, RealType b = 1.0);

*Preconditions:*  $0 < a$  and  $0 < b$ .

*Remarks:*  $a$  and  $b$  correspond to the respective parameters of the distribution.

RealType a() const;

*Returns:* The value of the  $a$  parameter with which the object was constructed.

RealType b() const;

*Returns:* The value of the  $b$  parameter with which the object was constructed.

28.5.9.4.5 Class template `extreme_value_distribution`

[rand.dist.pois.extreme]

An `extreme_value_distribution` random number distribution produces random numbers  $x$  distributed according to the probability density function in Formula 28.12.<sup>231</sup>

$$p(x|a,b) = \frac{1}{b} \cdot \exp\left(\frac{a-x}{b} - \exp\left(\frac{a-x}{b}\right)\right) \quad (28.12)$$

```
namespace std {
    template<class RealType = double>
    class extreme_value_distribution {
    public:
        // types
        using result_type = RealType;
        using param_type = unspecified;

        // constructor and reset functions
        extreme_value_distribution() : extreme_value_distribution(0.0) {}
        explicit extreme_value_distribution(RealType a, RealType b = 1.0);
        explicit extreme_value_distribution(const param_type& parm);
        void reset();

        // equality operators
        friend bool operator==(const extreme_value_distribution& x,
                               const extreme_value_distribution& y);

        // generating functions
        template<class URBG>
            result_type operator()(URBG& g);
        template<class URBG>
            result_type operator()(URBG& g, const param_type& parm);

        // property functions
        RealType a() const;
        RealType b() const;
        param_type param() const;
        void param(const param_type& parm);
        result_type min() const;
        result_type max() const;

        // inserters and extractors
        template<class charT, class traits>
            friend basic_ostream<charT, traits>&
                operator<<(basic_ostream<charT, traits>& os, const extreme_value_distribution& x);
        template<class charT, class traits>
            friend basic_istream<charT, traits>&
                operator>>(basic_istream<charT, traits>& is, extreme_value_distribution& x);
    };
}
```

```
explicit extreme_value_distribution(RealType a, RealType b = 1.0);
```

*Preconditions:*  $0 < b$ .

*Remarks:*  $a$  and  $b$  correspond to the respective parameters of the distribution.

```
RealType a() const;
```

*Returns:* The value of the  $a$  parameter with which the object was constructed.

```
RealType b() const;
```

*Returns:* The value of the  $b$  parameter with which the object was constructed.

<sup>231</sup>) The distribution corresponding to this probability density function is also known (with a possible change of variable) as the Gumbel Type I, the log-Weibull, or the Fisher-Tippett Type I distribution.

## 28.5.9.5 Normal distributions

[rand.dist.norm]

## 28.5.9.5.1 Class template normal\_distribution

[rand.dist.norm.normal]

A `normal_distribution` random number distribution produces random numbers  $x$  distributed according to the probability density function in Formula 28.13.

$$p(x|\mu, \sigma) = \frac{1}{\sigma\sqrt{2\pi}} \cdot \exp\left(-\frac{(x-\mu)^2}{2\sigma^2}\right) \quad (28.13)$$

The distribution parameters  $\mu$  and  $\sigma$  are also known as this distribution's *mean* and *standard deviation*.

```
namespace std {
    template<class RealType = double>
    class normal_distribution {
    public:
        // types
        using result_type = RealType;
        using param_type = unspecified;

        // constructors and reset functions
        normal_distribution() : normal_distribution(0.0) {}
        explicit normal_distribution(RealType mean, RealType stddev = 1.0);
        explicit normal_distribution(const param_type& parm);
        void reset();

        // equality operators
        friend bool operator==(const normal_distribution& x, const normal_distribution& y);

        // generating functions
        template<class URBG>
            result_type operator()(URBG& g);
        template<class URBG>
            result_type operator()(URBG& g, const param_type& parm);

        // property functions
        RealType mean() const;
        RealType stddev() const;
        param_type param() const;
        void param(const param_type& parm);
        result_type min() const;
        result_type max() const;

        // inserters and extractors
        template<class charT, class traits>
            friend basic_ostream<charT, traits>&
                operator<<(basic_ostream<charT, traits>& os, const normal_distribution& x);
        template<class charT, class traits>
            friend basic_istream<charT, traits>&
                operator>>(basic_istream<charT, traits>& is, normal_distribution& x);
    };
}
```

```
explicit normal_distribution(RealType mean, RealType stddev = 1.0);
```

*Preconditions:*  $0 < \text{stddev}$ .

*Remarks:* `mean` and `stddev` correspond to the respective parameters of the distribution.

```
RealType mean() const;
```

*Returns:* The value of the `mean` parameter with which the object was constructed.

```
RealType stddev() const;
```

*Returns:* The value of the `stddev` parameter with which the object was constructed.

**28.5.9.5.2 Class template lognormal\_distribution****[rand.dist.norm.lognormal]**

A `lognormal_distribution` random number distribution produces random numbers  $x > 0$  distributed according to the probability density function in Formula 28.14.

$$p(x | m, s) = \frac{1}{sx\sqrt{2\pi}} \cdot \exp\left(-\frac{(\ln x - m)^2}{2s^2}\right) \quad (28.14)$$

```
namespace std {
    template<class RealType = double>
    class lognormal_distribution {
    public:
        // types
        using result_type = RealType;
        using param_type = unspecified;

        // constructor and reset functions
        lognormal_distribution() : lognormal_distribution(0.0) {}
        explicit lognormal_distribution(RealType m, RealType s = 1.0);
        explicit lognormal_distribution(const param_type& parm);
        void reset();

        // equality operators
        friend bool operator==(const lognormal_distribution& x, const lognormal_distribution& y);

        // generating functions
        template<class URBG>
            result_type operator()(URBG& g);
        template<class URBG>
            result_type operator()(URBG& g, const param_type& parm);

        // property functions
        RealType m() const;
        RealType s() const;
        param_type param() const;
        void param(const param_type& parm);
        result_type min() const;
        result_type max() const;

        // inserters and extractors
        template<class charT, class traits>
            friend basic_ostream<charT, traits>&
                operator<<(basic_ostream<charT, traits>& os, const lognormal_distribution& x);
        template<class charT, class traits>
            friend basic_istream<charT, traits>&
                operator>>(basic_istream<charT, traits>& is, lognormal_distribution& x);
    };
}
```

`explicit lognormal_distribution(RealType m, RealType s = 1.0);`

*Preconditions:*  $0 < s$ .

*Remarks:* `m` and `s` correspond to the respective parameters of the distribution.

`RealType m() const;`

*Returns:* The value of the `m` parameter with which the object was constructed.

`RealType s() const;`

*Returns:* The value of the `s` parameter with which the object was constructed.

**28.5.9.5.3 Class template chi\_squared\_distribution****[rand.dist.norm.chisq]**

A `chi_squared_distribution` random number distribution produces random numbers  $x > 0$  distributed according to the probability density function in Formula 28.15.

$$p(x|n) = \frac{x^{(n/2)-1} \cdot e^{-x/2}}{\Gamma(n/2) \cdot 2^{n/2}} \quad (28.15)$$

```
namespace std {
    template<class RealType = double>
    class chi_squared_distribution {
    public:
        // types
        using result_type = RealType;
        using param_type = unspecified;

        // constructor and reset functions
        chi_squared_distribution() : chi_squared_distribution(1.0) {}
        explicit chi_squared_distribution(RealType n);
        explicit chi_squared_distribution(const param_type& parm);
        void reset();

        // equality operators
        friend bool operator==(const chi_squared_distribution& x, const chi_squared_distribution& y);

        // generating functions
        template<class URBG>
            result_type operator()(URBG& g);
        template<class URBG>
            result_type operator()(URBG& g, const param_type& parm);

        // property functions
        RealType n() const;
        param_type param() const;
        void param(const param_type& parm);
        result_type min() const;
        result_type max() const;

        // inserters and extractors
        template<class charT, class traits>
            friend basic_ostream<charT, traits>&
                operator<<(basic_ostream<charT, traits>& os, const chi_squared_distribution& x);
        template<class charT, class traits>
            friend basic_istream<charT, traits>&
                operator>>(basic_istream<charT, traits>& is, chi_squared_distribution& x);
    };
}

explicit chi_squared_distribution(RealType n);
```

*Preconditions:*  $0 < n$ .

*Remarks:*  $n$  corresponds to the parameter of the distribution.

`RealType n() const;`

*Returns:* The value of the  $n$  parameter with which the object was constructed.

**28.5.9.5.4 Class template cauchy\_distribution****[rand.dist.norm.cauchy]**

A `cauchy_distribution` random number distribution produces random numbers  $x$  distributed according to the probability density function in Formula 28.16.

$$p(x|a,b) = \left( \pi b \left( 1 + \left( \frac{x-a}{b} \right)^2 \right) \right)^{-1} \quad (28.16)$$

```

namespace std {
    template<class RealType = double>
    class cauchy_distribution {
    public:
        // types
        using result_type = RealType;
        using param_type = unspecified;

        // constructor and reset functions
        cauchy_distribution() : cauchy_distribution(0.0) {}
        explicit cauchy_distribution(RealType a, RealType b = 1.0);
        explicit cauchy_distribution(const param_type& parm);
        void reset();

        // equality operators
        friend bool operator==(const cauchy_distribution& x, const cauchy_distribution& y);

        // generating functions
        template<class URBG>
            result_type operator()(URBG& g);
        template<class URBG>
            result_type operator()(URBG& g, const param_type& parm);

        // property functions
        RealType a() const;
        RealType b() const;
        param_type param() const;
        void param(const param_type& parm);
        result_type min() const;
        result_type max() const;

        // inserters and extractors
        template<class charT, class traits>
            friend basic_ostream<charT, traits>&
                operator<<(basic_ostream<charT, traits>& os, const cauchy_distribution& x);
        template<class charT, class traits>
            friend basic_istream<charT, traits>&
                operator>>(basic_istream<charT, traits>& is, cauchy_distribution& x);
    };
}

```

explicit cauchy\_distribution(RealType a, RealType b = 1.0);

*Preconditions:*  $0 < b$ .

*Remarks:* a and b correspond to the respective parameters of the distribution.

RealType a() const;

*Returns:* The value of the a parameter with which the object was constructed.

RealType b() const;

*Returns:* The value of the b parameter with which the object was constructed.

#### 28.5.9.5.5 Class template fisher\_f\_distribution [rand.dist.norm.f]

A fisher\_f\_distribution random number distribution produces random numbers  $x \geq 0$  distributed according to the probability density function in Formula 28.17.

$$p(x|m,n) = \frac{\Gamma((m+n)/2)}{\Gamma(m/2)\Gamma(n/2)} \cdot \left(\frac{m}{n}\right)^{m/2} \cdot x^{(m/2)-1} \cdot \left(1 + \frac{mx}{n}\right)^{-(m+n)/2} \quad (28.17)$$

```

namespace std {
    template<class RealType = double>
    class fisher_f_distribution {
    public:
        // types
        using result_type = RealType;
        using param_type = unspecified;

        // constructor and reset functions
        fisher_f_distribution() : fisher_f_distribution(1.0) {}
        explicit fisher_f_distribution(RealType m, RealType n = 1.0);
        explicit fisher_f_distribution(const param_type& parm);
        void reset();

        // equality operators
        friend bool operator==(const fisher_f_distribution& x, const fisher_f_distribution& y);

        // generating functions
        template<class URBG>
            result_type operator()(URBG& g);
        template<class URBG>
            result_type operator()(URBG& g, const param_type& parm);

        // property functions
        RealType m() const;
        RealType n() const;
        param_type param() const;
        void param(const param_type& parm);
        result_type min() const;
        result_type max() const;

        // inserters and extractors
        template<class charT, class traits>
            friend basic_ostream<charT, traits>&
                operator<<(basic_ostream<charT, traits>& os, const fisher_f_distribution& x);
        template<class charT, class traits>
            friend basic_istream<charT, traits>&
                operator>>(basic_istream<charT, traits>& is, fisher_f_distribution& x);
    };
}

```

explicit fisher\_f\_distribution(RealType m, RealType n = 1);

*Preconditions:*  $0 < m$  and  $0 < n$ .

*Remarks:*  $m$  and  $n$  correspond to the respective parameters of the distribution.

RealType m() const;

*Returns:* The value of the  $m$  parameter with which the object was constructed.

RealType n() const;

*Returns:* The value of the  $n$  parameter with which the object was constructed.

#### 28.5.9.5.6 Class template student\_t\_distribution

[rand.dist.norm.t]

A `student_t_distribution` random number distribution produces random numbers  $x$  distributed according to the probability density function in Formula 28.18.

$$p(x|n) = \frac{1}{\sqrt{n\pi}} \cdot \frac{\Gamma((n+1)/2)}{\Gamma(n/2)} \cdot \left(1 + \frac{x^2}{n}\right)^{-(n+1)/2} \quad (28.18)$$

```

namespace std {
    template<class RealType = double>
    class student_t_distribution {
    public:
        // types
        using result_type = RealType;
        using param_type = unspecified;

        // constructor and reset functions
        student_t_distribution() : student_t_distribution(1.0) {}
        explicit student_t_distribution(RealType n);
        explicit student_t_distribution(const param_type& parm);
        void reset();

        // equality operators
        friend bool operator==(const student_t_distribution& x, const student_t_distribution& y);

        // generating functions
        template<class URBG>
            result_type operator()(URBG& g);
        template<class URBG>
            result_type operator()(URBG& g, const param_type& parm);

        // property functions
        RealType n() const;
        param_type param() const;
        void param(const param_type& parm);
        result_type min() const;
        result_type max() const;

        // inserters and extractors
        template<class charT, class traits>
            friend basic_ostream<charT, traits>&
                operator<<(basic_ostream<charT, traits>& os, const student_t_distribution& x);
        template<class charT, class traits>
            friend basic_istream<charT, traits>&
                operator>>(basic_istream<charT, traits>& is, student_t_distribution& x);
    };
}

explicit student_t_distribution(RealType n);

```

*Preconditions:*  $0 < n$ .

*Remarks:*  $n$  corresponds to the parameter of the distribution.

RealType n() const;

*Returns:* The value of the  $n$  parameter with which the object was constructed.

### 28.5.9.6 Sampling distributions

[rand.dist.samp]

#### 28.5.9.6.1 Class template discrete\_distribution

[rand.dist.samp.discrete]

A `discrete_distribution` random number distribution produces random integers  $i$ ,  $0 \leq i < n$ , distributed according to the discrete probability function in Formula 28.19.

$$P(i | p_0, \dots, p_{n-1}) = p_i \quad (28.19)$$

Unless specified otherwise, the distribution parameters are calculated as:  $p_k = w_k/S$  for  $k = 0, \dots, n-1$ , in which the values  $w_k$ , commonly known as the *weights*, shall be non-negative, non-NaN, and non-infinity. Moreover, the following relation shall hold:  $0 < S = w_0 + \dots + w_{n-1}$ .

```

namespace std {
    template<class IntType = int>
    class discrete_distribution {
    public:
        // types
        using result_type = IntType;
        using param_type = unspecified;

        // constructor and reset functions
        discrete_distribution();
        template<class InputIterator>
            discrete_distribution(InputIterator firstW, InputIterator lastW);
        discrete_distribution(initializer_list<double> w1);
        template<class UnaryOperation>
            discrete_distribution(size_t nw, double xmin, double xmax, UnaryOperation fw);
        explicit discrete_distribution(const param_type& parm);
        void reset();

        // equality operators
        friend bool operator==(const discrete_distribution& x, const discrete_distribution& y);

        // generating functions
        template<class URBG>
            result_type operator()(URBG& g);
        template<class URBG>
            result_type operator()(URBG& g, const param_type& parm);

        // property functions
        vector<double> probabilities() const;
        param_type param() const;
        void param(const param_type& parm);
        result_type min() const;
        result_type max() const;

        // inserters and extractors
        template<class charT, class traits>
            friend basic_ostream<charT, traits>&
                operator<<(basic_ostream<charT, traits>& os, const discrete_distribution& x);
        template<class charT, class traits>
            friend basic_istream<charT, traits>&
                operator>>(basic_istream<charT, traits>& is, discrete_distribution& x);
    };
}

```

discrete\_distribution();

*Effects:* Constructs a discrete\_distribution object with  $n = 1$  and  $p_0 = 1$ .

NOTE Such an object will always deliver the value 0.

```

template<class InputIterator>
discrete_distribution(InputIterator firstW, InputIterator lastW);

```

*Mandates:* `is_convertible_v<iterator_traits<InputIterator>::value_type, double>` is true.

*Preconditions:* InputIterator meets the Cpp17InputIterator requirements (25.3.5.3). If `firstW == lastW`, let  $n = 1$  and  $w_0 = 1$ . Otherwise, `[firstW, lastW)` forms a sequence  $w$  of length  $n > 0$ .

*Effects:* Constructs a discrete\_distribution object with probabilities given by the Formula 28.19.

```

discrete_distribution(initializer_list<double> w1);

```

*Effects:* Same as `discrete_distribution(w1.begin(), w1.end())`.

```

template<class UnaryOperation>
discrete_distribution(size_t nw, double xmin, double xmax, UnaryOperation fw);

```

*Mandates:* `is_invocable_r_v<double, UnaryOperation&, double>` is true.

*Preconditions:* If `nw = 0`, let  $n = 1$ , otherwise let  $n = \text{nw}$ . The relation  $0 < \delta = (\text{xmax} - \text{xmin})/n$  holds.

*Effects:* Constructs a `discrete_distribution` object with probabilities given by the formula above, using the following values: If `nw = 0`, let  $w_0 = 1$ . Otherwise, let  $w_k = \text{fw}(\text{xmin} + k \cdot \delta + \delta/2)$  for  $k = 0, \dots, n-1$ .

*Complexity:* The number of invocations of `fw` does not exceed  $n$ .

```
vector<double> probabilities() const;
```

*Returns:* A `vector<double>` whose `size` member returns  $n$  and whose `operator[]` member returns  $p_k$  when invoked with argument  $k$  for  $k = 0, \dots, n-1$ .

#### 28.5.9.6.2 Class template `piecewise_constant_distribution` [rand.dist.samp.pconst]

A `piecewise_constant_distribution` random number distribution produces random numbers  $x$ ,  $b_0 \leq x < b_n$ , uniformly distributed over each subinterval  $[b_i, b_{i+1})$  according to the probability density function in Formula 28.20.

$$p(x | b_0, \dots, b_n, \rho_0, \dots, \rho_{n-1}) = \rho_i, \text{ for } b_i \leq x < b_{i+1} \quad (28.20)$$

The  $n+1$  distribution parameters  $b_i$ , also known as this distribution's *interval boundaries*, shall satisfy the relation  $b_i < b_{i+1}$  for  $i = 0, \dots, n-1$ . Unless specified otherwise, the remaining  $n$  distribution parameters are calculated as:

$$\rho_k = \frac{w_k}{S \cdot (b_{k+1} - b_k)} \text{ for } k = 0, \dots, n-1,$$

in which the values  $w_k$ , commonly known as the *weights*, shall be non-negative, non-NaN, and non-infinity. Moreover, the following relation shall hold:  $0 < S = w_0 + \dots + w_{n-1}$ .

```
namespace std {
    template<class RealType = double>
    class piecewise_constant_distribution {
    public:
        // types
        using result_type = RealType;
        using param_type = unspecified;

        // constructor and reset functions
        piecewise_constant_distribution();
        template<class InputIteratorB, class InputIteratorW>
            piecewise_constant_distribution(InputIteratorB firstB, InputIteratorB lastB,
                                           InputIteratorW firstW);
        template<class UnaryOperation>
            piecewise_constant_distribution(initializer_list<RealType> bl, UnaryOperation fw);
        template<class UnaryOperation>
            piecewise_constant_distribution(size_t nw, RealType xmin, RealType xmax,
                                           UnaryOperation fw);
        explicit piecewise_constant_distribution(const param_type& parm);
        void reset();

        // equality operators
        friend bool operator==(const piecewise_constant_distribution& x,
                              const piecewise_constant_distribution& y);

        // generating functions
        template<class URBG>
            result_type operator()(URBG& g);
        template<class URBG>
            result_type operator()(URBG& g, const param_type& parm);

        // property functions
        vector<result_type> intervals() const;
        vector<result_type> densities() const;
        param_type param() const;
        void param(const param_type& parm);
        result_type min() const;
        result_type max() const;
    };
}
```

```

// inserters and extractors
template<class charT, class traits>
    friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const piecewise_constant_distribution& x);
template<class charT, class traits>
    friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is, piecewise_constant_distribution& x);
};
}

piecewise_constant_distribution();

```

*Effects:* Constructs a `piecewise_constant_distribution` object with  $n = 1$ ,  $\rho_0 = 1$ ,  $b_0 = 0$ , and  $b_1 = 1$ .

```

template<class InputIteratorB, class InputIteratorW>
piecewise_constant_distribution(InputIteratorB firstB, InputIteratorB lastB,
                               InputIteratorW firstW);

```

*Mandates:* Both of

- `is_convertible_v<iterator_traits<InputIteratorB>::value_type, double>`
- `is_convertible_v<iterator_traits<InputIteratorW>::value_type, double>`

are true.

*Preconditions:* `InputIteratorB` and `InputIteratorW` each meet the *Cpp17InputIterator* requirements (25.3.5.3). If `firstB == lastB` or `++firstB == lastB`, let  $n = 1$ ,  $w_0 = 1$ ,  $b_0 = 0$ , and  $b_1 = 1$ . Otherwise,  $[firstB, lastB)$  forms a sequence  $b$  of length  $n + 1$ , the length of the sequence  $w$  starting from `firstW` is at least  $n$ , and any  $w_k$  for  $k \geq n$  are ignored by the distribution.

*Effects:* Constructs a `piecewise_constant_distribution` object with parameters as specified above.

```

template<class UnaryOperation>
piecewise_constant_distribution(initializer_list<RealType> bl, UnaryOperation fw);

```

*Mandates:* `is_invocable_r_v<double, UnaryOperation&, double>` is true.

*Effects:* Constructs a `piecewise_constant_distribution` object with parameters taken or calculated from the following values: If `bl.size() < 2`, let  $n = 1$ ,  $w_0 = 1$ ,  $b_0 = 0$ , and  $b_1 = 1$ . Otherwise, let  $[bl.begin(), bl.end())$  form a sequence  $b_0, \dots, b_n$ , and let  $w_k = fw((b_{k+1} + b_k)/2)$  for  $k = 0, \dots, n - 1$ .

*Complexity:* The number of invocations of `fw` does not exceed  $n$ .

```

template<class UnaryOperation>
piecewise_constant_distribution(size_t nw, RealType xmin, RealType xmax, UnaryOperation fw);

```

*Mandates:* `is_invocable_r_v<double, UnaryOperation&, double>` is true.

*Preconditions:* If `nw = 0`, let  $n = 1$ , otherwise let  $n = nw$ . The relation  $0 < \delta = (xmax - xmin)/n$  holds.

*Effects:* Constructs a `piecewise_constant_distribution` object with parameters taken or calculated from the following values: Let  $b_k = xmin + k \cdot \delta$  for  $k = 0, \dots, n$ , and  $w_k = fw(b_k + \delta/2)$  for  $k = 0, \dots, n - 1$ .

*Complexity:* The number of invocations of `fw` does not exceed  $n$ .

```

vector<result_type> intervals() const;

```

*Returns:* A `vector<result_type>` whose `size` member returns  $n + 1$  and whose `operator[]` member returns  $b_k$  when invoked with argument  $k$  for  $k = 0, \dots, n$ .

```

vector<result_type> densities() const;

```

*Returns:* A `vector<result_type>` whose `size` member returns  $n$  and whose `operator[]` member returns  $\rho_k$  when invoked with argument  $k$  for  $k = 0, \dots, n - 1$ .

### 28.5.9.6.3 Class template `piecewise_linear_distribution` [rand.dist.samp.plinear]

A `piecewise_linear_distribution` random number distribution produces random numbers  $x$ ,  $b_0 \leq x < b_n$ , distributed over each subinterval  $[b_i, b_{i+1})$  according to the probability density function in Formula 28.21.

$$p(x | b_0, \dots, b_n, \rho_0, \dots, \rho_n) = \rho_i \cdot \frac{b_{i+1} - x}{b_{i+1} - b_i} + \rho_{i+1} \cdot \frac{x - b_i}{b_{i+1} - b_i}, \text{ for } b_i \leq x < b_{i+1}. \quad (28.21)$$

The  $n + 1$  distribution parameters  $b_i$ , also known as this distribution's *interval boundaries*, shall satisfy the relation  $b_i < b_{i+1}$  for  $i = 0, \dots, n - 1$ . Unless specified otherwise, the remaining  $n + 1$  distribution parameters are calculated as  $\rho_k = w_k/S$  for  $k = 0, \dots, n$ , in which the values  $w_k$ , commonly known as the *weights at boundaries*, shall be non-negative, non-NaN, and non-infinity. Moreover, the following relation shall hold:

$$0 < S = \frac{1}{2} \cdot \sum_{k=0}^{n-1} (w_k + w_{k+1}) \cdot (b_{k+1} - b_k) .$$

```
namespace std {
    template<class RealType = double>
    class piecewise_linear_distribution {
    public:
        // types
        using result_type = RealType;
        using param_type = unspecified;

        // constructor and reset functions
        piecewise_linear_distribution();
        template<class InputIteratorB, class InputIteratorW>
            piecewise_linear_distribution(InputIteratorB firstB, InputIteratorB lastB,
                                         InputIteratorW firstW);
        template<class UnaryOperation>
            piecewise_linear_distribution(initializer_list<RealType> bl, UnaryOperation fw);
        template<class UnaryOperation>
            piecewise_linear_distribution(size_t nw, RealType xmin, RealType xmax, UnaryOperation fw);
        explicit piecewise_linear_distribution(const param_type& parm);
        void reset();

        // equality operators
        friend bool operator==(const piecewise_linear_distribution& x,
                               const piecewise_linear_distribution& y);

        // generating functions
        template<class URBG>
            result_type operator()(URBG& g);
        template<class URBG>
            result_type operator()(URBG& g, const param_type& parm);

        // property functions
        vector<result_type> intervals() const;
        vector<result_type> densities() const;
        param_type param() const;
        void param(const param_type& parm);
        result_type min() const;
        result_type max() const;

        // inserters and extractors
        template<class charT, class traits>
            friend basic_ostream<charT, traits>&
                operator<<(basic_ostream<charT, traits>& os, const piecewise_linear_distribution& x);
        template<class charT, class traits>
            friend basic_istream<charT, traits>&
                operator>>(basic_istream<charT, traits>& is, piecewise_linear_distribution& x);
    };
}

piecewise_linear_distribution();
```

*Effects:* Constructs a `piecewise_linear_distribution` object with  $n = 1$ ,  $\rho_0 = \rho_1 = 1$ ,  $b_0 = 0$ , and  $b_1 = 1$ .

```
template<class InputIteratorB, class InputIteratorW>
piecewise_linear_distribution(InputIteratorB firstB, InputIteratorB lastB,
                             InputIteratorW firstW);
```

*Mandates:* `is_invocable_r_v<double, UnaryOperation&, double>` is true.

*Preconditions:* `InputIteratorB` and `InputIteratorW` each meet the *Cpp17InputIterator* requirements (25.3.5.3). If `firstB == lastB` or `++firstB == lastB`, let  $n = 1$ ,  $\rho_0 = \rho_1 = 1$ ,  $b_0 = 0$ , and  $b_1 = 1$ . Otherwise,  $[firstB, lastB)$  forms a sequence  $b$  of length  $n + 1$ , the length of the sequence  $w$  starting from `firstW` is at least  $n + 1$ , and any  $w_k$  for  $k \geq n + 1$  are ignored by the distribution.

*Effects:* Constructs a `piecewise_linear_distribution` object with parameters as specified above.

```
template<class UnaryOperation>
piecewise_linear_distribution(initializer_list<RealType> bl, UnaryOperation fw);
```

*Mandates:* `is_invocable_r_v<double, UnaryOperation&, double>` is true.

*Effects:* Constructs a `piecewise_linear_distribution` object with parameters taken or calculated from the following values: If `bl.size() < 2`, let  $n = 1$ ,  $\rho_0 = \rho_1 = 1$ ,  $b_0 = 0$ , and  $b_1 = 1$ . Otherwise, let  $[bl.begin(), bl.end())$  form a sequence  $b_0, \dots, b_n$ , and let  $w_k = fw(b_k)$  for  $k = 0, \dots, n$ .

*Complexity:* The number of invocations of `fw` does not exceed  $n + 1$ .

```
template<class UnaryOperation>
piecewise_linear_distribution(size_t nw, RealType xmin, RealType xmax, UnaryOperation fw);
```

*Mandates:* `is_invocable_r_v<double, UnaryOperation&, double>` is true.

*Preconditions:* If `nw = 0`, let  $n = 1$ , otherwise let  $n = nw$ . The relation  $0 < \delta = (xmax - xmin)/n$  holds.

*Effects:* Constructs a `piecewise_linear_distribution` object with parameters taken or calculated from the following values: Let  $b_k = xmin + k \cdot \delta$  for  $k = 0, \dots, n$ , and  $w_k = fw(b_k)$  for  $k = 0, \dots, n$ .

*Complexity:* The number of invocations of `fw` does not exceed  $n + 1$ .

```
vector<result_type> intervals() const;
```

*Returns:* A `vector<result_type>` whose `size` member returns  $n + 1$  and whose `operator[]` member returns  $b_k$  when invoked with argument  $k$  for  $k = 0, \dots, n$ .

```
vector<result_type> densities() const;
```

*Returns:* A `vector<result_type>` whose `size` member returns  $n$  and whose `operator[]` member returns  $\rho_k$  when invoked with argument  $k$  for  $k = 0, \dots, n$ .

## 28.5.10 Low-quality random number generation

[c.math.rand]

NOTE 1 The header `<cstdlib>` (17.2.2) declares the functions described in this subclause.

```
int rand();
void srand(unsigned int seed);
```

*Effects:* The `rand` and `srand` functions have the semantics specified in the C standard library.

*Remarks:* The implementation may specify that particular library functions may call `rand`. It is implementation-defined whether the `rand` function may introduce data races (16.4.6.10).

NOTE 2 The other random number generation facilities in this document (28.5) are often preferable to `rand`, because `rand`'s underlying algorithm is unspecified. Use of `rand` therefore continues to be non-portable, with unpredictable and oft-questionable quality and performance.

See also ISO/IEC 9899:2018, 7.22.2.

## 28.6 Numeric arrays

[numarray]

### 28.6.1 Header `<valarray>` synopsis

[valarray.syn]

```
#include <initializer_list> // see 17.10.2
```

```
namespace std {
    template<class T> class valarray; // An array of type T
    class slice; // a BLAS-like slice out of an array
    template<class T> class slice_array;
```

```

template<class T> valarray<T> pow(const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> pow(const valarray<T>&, const typename valarray<T>::value_type&);
template<class T> valarray<T> pow(const typename valarray<T>::value_type&, const valarray<T>&);

template<class T> valarray<T> sin (const valarray<T>&);
template<class T> valarray<T> sinh (const valarray<T>&);
template<class T> valarray<T> sqrt (const valarray<T>&);
template<class T> valarray<T> tan (const valarray<T>&);
template<class T> valarray<T> tanh (const valarray<T>&);

template<class T> unspecified1 begin(valarray<T>& v);
template<class T> unspecified2 begin(const valarray<T>& v);
template<class T> unspecified1 end(valarray<T>& v);
template<class T> unspecified2 end(const valarray<T>& v);
}

```

The header `<valarray>` defines five class templates (`valarray`, `slice_array`, `gslice_array`, `mask_array`, and `indirect_array`), two classes (`slice` and `gslice`), and a series of related function templates for representing and manipulating arrays of values.

The `valarray` array classes are defined to be free of certain forms of aliasing, thus allowing operations on these classes to be optimized.

Any function returning a `valarray<T>` is permitted to return an object of another type, provided all the `const` member functions of `valarray<T>` are also applicable to this type. This return type shall not add more than two levels of template nesting over the most deeply nested argument type.<sup>232</sup>

Implementations introducing such replacement types shall provide additional functions and operators as follows:

- for every function taking a `const valarray<T>&` other than `begin` and `end` (28.6.10), identical functions taking the replacement types shall be added;
- for every function taking two `const valarray<T>&` arguments, identical functions taking every combination of `const valarray<T>&` and replacement types shall be added.

In particular, an implementation shall allow a `valarray<T>` to be constructed from such replacement types and shall allow assignments and compound assignments of such types to `valarray<T>`, `slice_array<T>`, `gslice_array<T>`, `mask_array<T>` and `indirect_array<T>` objects.

These library functions are permitted to throw a `bad_alloc` (17.6.4.1) exception if there are not sufficient resources available to carry out the operation. Note that the exception is not mandated.

## 28.6.2 Class template `valarray`

[template.valarray]

### 28.6.2.1 Overview

[template.valarray.overview]

```

namespace std {
    template<class T> class valarray {
    public:
        using value_type = T;

        // 28.6.2.2, construct/destroy
        valarray();
        explicit valarray(size_t);
        valarray(const T&, size_t);
        valarray(const T*, size_t);
        valarray(const valarray&);
        valarray(valarray&&) noexcept;
        valarray(const slice_array<T>&);
        valarray(const gslice_array<T>&);
        valarray(const mask_array<T>&);
        valarray(const indirect_array<T>&);
        valarray(initializer_list<T>);
        ~valarray();
    };
}

```

232) Annex B recommends a minimum number of recursively nested template instantiations. This requirement thus indirectly suggests a minimum allowable complexity for `valarray` expressions.

```

// 28.6.2.3, assignment
valarray& operator=(const valarray&);
valarray& operator=(valarray&&) noexcept;
valarray& operator=(initializer_list<T>);
valarray& operator=(const T&);
valarray& operator=(const slice_array<T>&);
valarray& operator=(const gslice_array<T>&);
valarray& operator=(const mask_array<T>&);
valarray& operator=(const indirect_array<T>&);

// 28.6.2.4, element access
const T&      operator[](size_t) const;
T&           operator[](size_t);

// 28.6.2.5, subset operations
valarray      operator[](slice) const;
slice_array<T> operator[](slice);
valarray      operator[](const gslice&) const;
gslice_array<T> operator[](const gslice&);
valarray      operator[](const valarray<bool>&) const;
mask_array<T> operator[](const valarray<bool>&);
valarray      operator[](const valarray<size_t>&) const;
indirect_array<T> operator[](const valarray<size_t>&);

// 28.6.2.6, unary operators
valarray operator+() const;
valarray operator-() const;
valarray operator~() const;
valarray<bool> operator!() const;

// 28.6.2.7, compound assignment
valarray& operator*=(const T&);
valarray& operator/=(const T&);
valarray& operator%=(const T&);
valarray& operator+=(const T&);
valarray& operator-=(const T&);
valarray& operator^=(const T&);
valarray& operator&=(const T&);
valarray& operator|=(const T&);
valarray& operator<<=(const T&);
valarray& operator>>=(const T&);

valarray& operator*=(const valarray&);
valarray& operator/=(const valarray&);
valarray& operator%=(const valarray&);
valarray& operator+=(const valarray&);
valarray& operator-=(const valarray&);
valarray& operator^=(const valarray&);
valarray& operator&=(const valarray&);
valarray& operator|=(const valarray&);
valarray& operator<<=(const valarray&);
valarray& operator>>=(const valarray&);

// 28.6.2.8, member functions
void swap(valarray&) noexcept;

size_t size() const;

T sum() const;
T min() const;
T max() const;

valarray shift(int) const;
valarray cshift(int) const;

```

```

    valarray apply(T func(T)) const;
    valarray apply(T func(const T&)) const;
    void resize(size_t sz, T c = T());
};

template<class T, size_t cnt> valarray(const T(&)[cnt], size_t) -> valarray<T>;
}

```

The class template `valarray<T>` is a one-dimensional smart array, with elements numbered sequentially from zero. It is a representation of the mathematical concept of an ordered set of values. For convenience, an object of type `valarray<T>` is referred to as an “array” throughout the remainder of 28.6. The illusion of higher dimensionality may be produced by the familiar idiom of computed indices, together with the powerful subsetting capabilities provided by the generalized subscript operators.<sup>233</sup>

### 28.6.2.2 Constructors [valarray.cons]

```
valarray();
```

*Effects:* Constructs a `valarray` that has zero length.<sup>234</sup>

```
explicit valarray(size_t n);
```

*Effects:* Constructs a `valarray` that has length `n`. Each element of the array is value-initialized (9.4).

```
valarray(const T& v, size_t n);
```

*Effects:* Constructs a `valarray` that has length `n`. Each element of the array is initialized with `v`.

```
valarray(const T* p, size_t n);
```

*Preconditions:* `[p, p + n)` is a valid range.

*Effects:* Constructs a `valarray` that has length `n`. The values of the elements of the array are initialized with the first `n` values pointed to by the first argument.<sup>235</sup>

```
valarray(const valarray& v);
```

*Effects:* Constructs a `valarray` that has the same length as `v`. The elements are initialized with the values of the corresponding elements of `v`.<sup>236</sup>

```
valarray(valarray&& v) noexcept;
```

*Effects:* Constructs a `valarray` that has the same length as `v`. The elements are initialized with the values of the corresponding elements of `v`.

*Complexity:* Constant.

```
valarray(initializer_list<T> il);
```

*Effects:* Equivalent to `valarray(il.begin(), il.size())`.

```
valarray(const slice_array<T>&);
```

```
valarray(const gslice_array<T>&);
```

```
valarray(const mask_array<T>&);
```

```
valarray(const indirect_array<T>&);
```

These conversion constructors convert one of the four reference templates to a `valarray`.

```
~valarray();
```

*Effects:* The destructor is applied to every element of `*this`; an implementation may return all allocated memory.

233) The intent is to specify an array template that has the minimum functionality necessary to address aliasing ambiguities and the proliferation of temporary objects. Thus, the `valarray` template is neither a matrix class nor a field class. However, it is a very useful building block for designing such classes.

234) This default constructor is essential, since arrays of `valarray` can be useful. After initialization, the length of an empty array can be increased with the `resize` member function.

235) This constructor is the preferred method for converting a C array to a `valarray` object.

236) This copy constructor creates a distinct array rather than an alias. Implementations in which arrays share storage are permitted, but they would need to implement a copy-on-reference mechanism to ensure that arrays are conceptually distinct.

**28.6.2.3 Assignment****[valarray.assign]**

```
valarray& operator=(const valarray& v);
```

*Effects:* Each element of the **\*this** array is assigned the value of the corresponding element of **v**. If the length of **v** is not equal to the length of **\*this**, resizes **\*this** to make the two arrays the same length, as if by calling **resize(v.size())**, before performing the assignment.

*Postconditions:* **size() == v.size()**.

*Returns:* **\*this**.

```
valarray& operator=(valarray&& v) noexcept;
```

*Effects:* **\*this** obtains the value of **v**. The value of **v** after the assignment is not specified.

*Returns:* **\*this**.

*Complexity:* Linear.

```
valarray& operator=(initializer_list<T> il);
```

*Effects:* Equivalent to: **return \*this = valarray(il);**

```
valarray& operator=(const T& v);
```

*Effects:* Assigns **v** to each element of **\*this**.

*Returns:* **\*this**.

```
valarray& operator=(const slice_array<T>&);
```

```
valarray& operator=(const gslice_array<T>&);
```

```
valarray& operator=(const mask_array<T>&);
```

```
valarray& operator=(const indirect_array<T>&);
```

*Preconditions:* The length of the array to which the argument refers equals **size()**. The value of an element in the left-hand side of a **valarray** assignment operator does not depend on the value of another element in that left-hand side.

These operators allow the results of a generalized subscripting operation to be assigned directly to a **valarray**.

**28.6.2.4 Element access****[valarray.access]**

```
const T& operator[](size_t n) const;
```

```
T& operator[](size_t n);
```

*Preconditions:* **n < size()** is true.

*Returns:* A reference to the corresponding element of the array.

NOTE 1 The expression **(a[i] = q, a[i]) == q** evaluates to **true** for any non-constant **valarray<T> a**, any **T q**, and for any **size\_t i** such that the value of **i** is less than the length of **a**.

*Remarks:* The expression **addressof(a[i+j]) == addressof(a[i]) + j** evaluates to **true** for all **size\_t i** and **size\_t j** such that **i+j < a.size()**.

The expression **addressof(a[i]) != addressof(b[j])** evaluates to **true** for any two arrays **a** and **b** and for any **size\_t i** and **size\_t j** such that **i < a.size()** and **j < b.size()**.

NOTE 2 This property indicates an absence of aliasing and can be used to advantage by optimizing compilers. Compilers can take advantage of inlining, constant propagation, loop fusion, tracking of pointers obtained from **operator new**, and other techniques to generate efficient **valarrays**.

The reference returned by the subscript operator for an array shall be valid until the member function **resize(size\_t, T)** (28.6.2.8) is called for that array or until the lifetime of that array ends, whichever happens first.

**28.6.2.5 Subset operations****[valarray.sub]**

The member **operator[]** is overloaded to provide several ways to select sequences of elements from among those controlled by **\*this**. Each of these operations returns a subset of the array. The **const**-qualified versions return this subset as a new **valarray** object. The non-**const** versions return a class template object which has reference semantics to the original array, working in conjunction with various overloads of **operator=**

and other assigning operators to allow selective replacement (slicing) of the controlled sequence. In each case the selected element(s) shall exist.

`valarray operator[](slice slicearr) const;`

*Returns:* A `valarray` containing those elements of the controlled sequence designated by `slicearr`.

EXAMPLE 1

```
const valarray<char> v0("abcdefghijklmnop", 16);
// v0[slice(2, 5, 3)] returns valarray<char>("cfilo", 5)
```

`slice_array<T> operator[](slice slicearr);`

*Returns:* An object that holds references to elements of the controlled sequence selected by `slicearr`.

EXAMPLE 2

```
valarray<char> v0("abcdefghijklmnop", 16);
valarray<char> v1("ABCDE", 5);
v0[slice(2, 5, 3)] = v1;
// v0 == valarray<char>("abAdeBghCjkdMnEp", 16);
```

`valarray operator[](const gslice& gslicearr) const;`

*Returns:* A `valarray` containing those elements of the controlled sequence designated by `gslicearr`.

EXAMPLE 3

```
const valarray<char> v0("abcdefghijklmnop", 16);
const size_t lv[] = { 2, 3 };
const size_t dv[] = { 7, 2 };
const valarray<size_t> len(lv, 2), str(dv, 2);
// v0[gslice(3, len, str)] returns
// valarray<char>("dfhkmo", 6)
```

`gslice_array<T> operator[](const gslice& gslicearr);`

*Returns:* An object that holds references to elements of the controlled sequence selected by `gslicearr`.

EXAMPLE 4

```
valarray<char> v0("abcdefghijklmnop", 16);
valarray<char> v1("ABCDEF", 6);
const size_t lv[] = { 2, 3 };
const size_t dv[] = { 7, 2 };
const valarray<size_t> len(lv, 2), str(dv, 2);
v0[gslice(3, len, str)] = v1;
// v0 == valarray<char>("abcAeBgCijDlEnFp", 16)
```

`valarray operator[](const valarray<bool>& boolarr) const;`

*Returns:* A `valarray` containing those elements of the controlled sequence designated by `boolarr`.

EXAMPLE 5

```
const valarray<char> v0("abcdefghijklmnop", 16);
const bool vb[] = { false, false, true, true, false, true };
// v0[valarray<bool>(vb, 6)] returns
// valarray<char>("cdf", 3)
```

`mask_array<T> operator[](const valarray<bool>& boolarr);`

*Returns:* An object that holds references to elements of the controlled sequence selected by `boolarr`.

EXAMPLE 6

```
valarray<char> v0("abcdefghijklmnop", 16);
valarray<char> v1("ABC", 3);
const bool vb[] = { false, false, true, true, false, true };
v0[valarray<bool>(vb, 6)] = v1;
// v0 == valarray<char>("abABeCghijklmnop", 16)
```

`valarray operator[](const valarray<size_t>& indarr) const;`

*Returns:* A `valarray` containing those elements of the controlled sequence designated by `indarr`.

## EXAMPLE 7

```
const valarray<char> v0("abcdefghijklmnp", 16);
const size_t vi[] = { 7, 5, 2, 3, 8 };
// v0[valarray<size_t>(vi, 5)] returns
// valarray<char>("hfcdi", 5)
```

```
indirect_array<T> operator[](const valarray<size_t>& indarr);
```

*Returns:* An object that holds references to elements of the controlled sequence selected by `indarr`.

## EXAMPLE 8

```
valarray<char> v0("abcdefghijklmnp", 16);
valarray<char> v1("ABCDE", 5);
const size_t vi[] = { 7, 5, 2, 3, 8 };
v0[valarray<size_t>(vi, 5)] = v1;
// v0 == valarray<char>("abCDeBgAEjklmnp", 16)
```

## 28.6.2.6 Unary operators

[valarray.unary]

```
valarray operator+() const;
valarray operator-() const;
valarray operator~() const;
valarray<bool> operator!() const;
```

*Mandates:* The indicated operator can be applied to operands of type `T` and returns a value of type `T` (`bool` for `operator!`) or which may be unambiguously implicitly converted to type `T` (`bool` for `operator!`).

*Returns:* A `valarray` whose length is `size()`. Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding element of the array.

## 28.6.2.7 Compound assignment

[valarray.cassign]

```
valarray& operator*= (const valarray& v);
valarray& operator/= (const valarray& v);
valarray& operator%= (const valarray& v);
valarray& operator+= (const valarray& v);
valarray& operator-= (const valarray& v);
valarray& operator^= (const valarray& v);
valarray& operator&= (const valarray& v);
valarray& operator|= (const valarray& v);
valarray& operator<<= (const valarray& v);
valarray& operator>>= (const valarray& v);
```

*Mandates:* The indicated operator can be applied to two operands of type `T`.

*Preconditions:* `size() == v.size()` is true.

The value of an element in the left-hand side of a `valarray` compound assignment operator does not depend on the value of another element in that left hand side.

*Effects:* Each of these operators performs the indicated operation on each of the elements of `*this` and the corresponding element of `v`.

*Returns:* `*this`.

*Remarks:* The appearance of an array on the left-hand side of a compound assignment does not invalidate references or pointers.

```
valarray& operator*= (const T& v);
valarray& operator/= (const T& v);
valarray& operator%= (const T& v);
valarray& operator+= (const T& v);
valarray& operator-= (const T& v);
valarray& operator^= (const T& v);
valarray& operator&= (const T& v);
valarray& operator|= (const T& v);
valarray& operator<<= (const T& v);
```

```
valarray& operator>>=(const T& v);
```

*Mandates:* The indicated operator can be applied to two operands of type T.

*Effects:* Each of these operators applies the indicated operation to each element of *\*this* and v.

*Returns:* *\*this*

*Remarks:* The appearance of an array on the left-hand side of a compound assignment does not invalidate references or pointers to the elements of the array.

### 28.6.2.8 Member functions

[valarray.members]

```
void swap(valarray& v) noexcept;
```

*Effects:* *\*this* obtains the value of v. v obtains the value of *\*this*.

*Complexity:* Constant.

```
size_t size() const;
```

*Returns:* The number of elements in the array.

*Complexity:* Constant time.

```
T sum() const;
```

*Mandates:* *operator+=* can be applied to operands of type T.

*Preconditions:* *size()* > 0 is true.

*Returns:* The sum of all the elements of the array. If the array has length 1, returns the value of element 0. Otherwise, the returned value is calculated by applying *operator+=* to a copy of an element of the array and all other elements of the array in an unspecified order.

```
T min() const;
```

*Preconditions:* *size()* > 0 is true.

*Returns:* The minimum value contained in *\*this*. For an array of length 1, the value of element 0 is returned. For all other array lengths, the determination is made using *operator<*.

```
T max() const;
```

*Preconditions:* *size()* > 0 is true.

*Returns:* The maximum value contained in *\*this*. For an array of length 1, the value of element 0 is returned. For all other array lengths, the determination is made using *operator<*.

```
valarray shift(int n) const;
```

*Returns:* A valarray of length *size()*, each of whose elements *I* is *(\*this)[I + n]* if *I + n* is non-negative and less than *size()*, otherwise T().

NOTE If element zero is taken as the leftmost element, a positive value of *n* shifts the elements left *n* places, with zero fill.

EXAMPLE If the argument has the value  $-2$ , the first two elements of the result will be value-initialized (9.4); the third element of the result will be assigned the value of the first element of *\*this*; etc.

```
valarray cshift(int n) const;
```

*Returns:* A valarray of length *size()* that is a circular shift of *\*this*. If element zero is taken as the leftmost element, a non-negative value of *n* shifts the elements circularly left *n* places and a negative value of *n* shifts the elements circularly right  $-n$  places.

```
valarray apply(T func(T)) const;
```

```
valarray apply(T func(const T&)) const;
```

*Returns:* A valarray whose length is *size()*. Each element of the returned array is assigned the value returned by applying the argument function to the corresponding element of *\*this*.

```
void resize(size_t sz, T c = T());
```

*Effects:* Changes the length of the *\*this* array to *sz* and then assigns to each element the value of the second argument. Resizing invalidates all pointers and references to elements in the array.

**28.6.3 valarray non-member operations**

[valarray.nonmembers]

**28.6.3.1 Binary operators**

[valarray.binary]

```

template<class T> valarray<T> operator* (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator/ (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator% (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator+ (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator- (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator^ (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator& (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator| (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator<< (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator>> (const valarray<T>&, const valarray<T>&);

```

*Mandates:* The indicated operator can be applied to operands of type T and returns a value of type T or which can be unambiguously implicitly converted to T.

*Preconditions:* The argument arrays have the same length.

*Returns:* A valarray whose length is equal to the lengths of the argument arrays. Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding elements of the argument arrays.

```

template<class T> valarray<T> operator* (const valarray<T>&,
                                         const typename valarray<T>::value_type&);
template<class T> valarray<T> operator* (const typename valarray<T>::value_type&,
                                         const valarray<T>&);
template<class T> valarray<T> operator/ (const valarray<T>&,
                                         const typename valarray<T>::value_type&);
template<class T> valarray<T> operator/ (const typename valarray<T>::value_type&,
                                         const valarray<T>&);
template<class T> valarray<T> operator% (const valarray<T>&,
                                         const typename valarray<T>::value_type&);
template<class T> valarray<T> operator% (const typename valarray<T>::value_type&,
                                         const valarray<T>&);
template<class T> valarray<T> operator+ (const valarray<T>&,
                                         const typename valarray<T>::value_type&);
template<class T> valarray<T> operator+ (const typename valarray<T>::value_type&,
                                         const valarray<T>&);
template<class T> valarray<T> operator- (const valarray<T>&,
                                         const typename valarray<T>::value_type&);
template<class T> valarray<T> operator- (const typename valarray<T>::value_type&,
                                         const valarray<T>&);
template<class T> valarray<T> operator^ (const valarray<T>&,
                                         const typename valarray<T>::value_type&);
template<class T> valarray<T> operator^ (const typename valarray<T>::value_type&,
                                         const valarray<T>&);
template<class T> valarray<T> operator& (const valarray<T>&,
                                         const typename valarray<T>::value_type&);
template<class T> valarray<T> operator& (const typename valarray<T>::value_type&,
                                         const valarray<T>&);
template<class T> valarray<T> operator| (const valarray<T>&,
                                         const typename valarray<T>::value_type&);
template<class T> valarray<T> operator| (const typename valarray<T>::value_type&,
                                         const valarray<T>&);
template<class T> valarray<T> operator<< (const valarray<T>&,
                                         const typename valarray<T>::value_type&);
template<class T> valarray<T> operator<< (const typename valarray<T>::value_type&,
                                         const valarray<T>&);
template<class T> valarray<T> operator>> (const valarray<T>&,
                                         const typename valarray<T>::value_type&);
template<class T> valarray<T> operator>> (const typename valarray<T>::value_type&,
                                         const valarray<T>&);

```

*Mandates:* The indicated operator can be applied to operands of type T and returns a value of type T or which can be unambiguously implicitly converted to T.

*Returns:* A `valarray` whose length is equal to the length of the array argument. Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding element of the array argument and the non-array argument.

### 28.6.3.2 Logical operators

[`valarray.comparison`]

```
template<class T> valarray<bool> operator==(const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator!=(const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator< (const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator> (const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator<=(const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator>=(const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator&&(const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator|| (const valarray<T>&, const valarray<T>&);
```

*Mandates:* The indicated operator can be applied to operands of type `T` and returns a value of type `bool` or which can be unambiguously implicitly converted to `bool`.

*Preconditions:* The two array arguments have the same length.

*Returns:* A `valarray<bool>` whose length is equal to the length of the array arguments. Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding elements of the argument arrays.

```
template<class T> valarray<bool> operator==(const valarray<T>&,
                                             const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator==(const typename valarray<T>::value_type&,
                                             const valarray<T>&);
template<class T> valarray<bool> operator!=(const valarray<T>&,
                                             const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator!=(const typename valarray<T>::value_type&,
                                             const valarray<T>&);
template<class T> valarray<bool> operator< (const valarray<T>&,
                                             const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator< (const typename valarray<T>::value_type&,
                                             const valarray<T>&);
template<class T> valarray<bool> operator> (const valarray<T>&,
                                             const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator> (const typename valarray<T>::value_type&,
                                             const valarray<T>&);
template<class T> valarray<bool> operator<=(const valarray<T>&,
                                             const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator<=(const typename valarray<T>::value_type&,
                                             const valarray<T>&);
template<class T> valarray<bool> operator>=(const valarray<T>&,
                                             const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator>=(const typename valarray<T>::value_type&,
                                             const valarray<T>&);
template<class T> valarray<bool> operator&&(const valarray<T>&,
                                             const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator&&(const typename valarray<T>::value_type&,
                                             const valarray<T>&);
template<class T> valarray<bool> operator|| (const valarray<T>&,
                                             const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator|| (const typename valarray<T>::value_type&,
                                             const valarray<T>&);
```

*Mandates:* The indicated operator can be applied to operands of type `T` and returns a value of type `bool` or which can be unambiguously implicitly converted to `bool`.

*Returns:* A `valarray<bool>` whose length is equal to the length of the array argument. Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding element of the array and the non-array argument.

### 28.6.3.3 Transcendentals

[`valarray.transcend`]

```
template<class T> valarray<T> abs (const valarray<T>&);
```

```

template<class T> valarray<T> acos (const valarray<T>&);
template<class T> valarray<T> asin (const valarray<T>&);
template<class T> valarray<T> atan (const valarray<T>&);
template<class T> valarray<T> atan2(const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> atan2(const valarray<T>&, const typename valarray<T>::value_type&);
template<class T> valarray<T> atan2(const typename valarray<T>::value_type&, const valarray<T>&);
template<class T> valarray<T> cos (const valarray<T>&);
template<class T> valarray<T> cosh (const valarray<T>&);
template<class T> valarray<T> exp (const valarray<T>&);
template<class T> valarray<T> log (const valarray<T>&);
template<class T> valarray<T> log10(const valarray<T>&);
template<class T> valarray<T> pow (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> pow (const valarray<T>&, const typename valarray<T>::value_type&);
template<class T> valarray<T> pow (const typename valarray<T>::value_type&, const valarray<T>&);
template<class T> valarray<T> sin (const valarray<T>&);
template<class T> valarray<T> sinh (const valarray<T>&);
template<class T> valarray<T> sqrt (const valarray<T>&);
template<class T> valarray<T> tan (const valarray<T>&);
template<class T> valarray<T> tanh (const valarray<T>&);

```

*Mandates:* A unique function with the indicated name can be applied (unqualified) to an operand of type T. This function returns a value of type T or which can be unambiguously implicitly converted to type T.

#### 28.6.3.4 Specialized algorithms

[valarray.special]

```
template<class T> void swap(valarray<T>& x, valarray<T>& y) noexcept;
```

*Effects:* Equivalent to `x.swap(y)`.

#### 28.6.4 Class slice

[class.slice]

##### 28.6.4.1 Overview

[class.slice.overview]

```

namespace std {
    class slice {
    public:
        slice();
        slice(size_t, size_t, size_t);
        slice(const slice&);

        size_t start() const;
        size_t size() const;
        size_t stride() const;

        friend bool operator==(const slice& x, const slice& y);
    };
}

```

The `slice` class represents a BLAS-like slice from an array. Such a slice is specified by a starting index, a length, and a stride.<sup>237</sup>

##### 28.6.4.2 Constructors

[cons.slice]

```

slice();
slice(size_t start, size_t length, size_t stride);

```

The default constructor is equivalent to `slice(0, 0, 0)`. A default constructor is provided only to permit the declaration of arrays of slices. The constructor with arguments for a slice takes a start, length, and stride parameter.

EXAMPLE `slice(3, 8, 2)` constructs a slice which selects elements 3, 5, 7, ..., 17 from an array.

<sup>237</sup>) BLAS stands for *Basic Linear Algebra Subprograms*. C++ programs can instantiate this class. See, for example, Dongarra, Du Croz, Duff, and Hammerling: *A set of Level 3 Basic Linear Algebra Subprograms*; Technical Report MCS-P1-0888, Argonne National Laboratory (USA), Mathematics and Computer Science Division, August, 1988.

**28.6.4.3 Access functions**

[slice.access]

```
size_t start() const;
size_t size() const;
size_t stride() const;
```

*Returns:* The start, length, or stride specified by a `slice` object.

*Complexity:* Constant time.

**28.6.4.4 Operators**

[slice.ops]

```
friend bool operator==(const slice& x, const slice& y);
```

*Effects:* Equivalent to:

```
return x.start() == y.start() && x.size() == y.size() && x.stride() == y.stride();
```

**28.6.5 Class template `slice_array`**

[template.slice.array]

**28.6.5.1 Overview**

[template.slice.array.overview]

```
namespace std {
    template<class T> class slice_array {
    public:
        using value_type = T;

        void operator= (const valarray<T>&) const;
        void operator*= (const valarray<T>&) const;
        void operator/= (const valarray<T>&) const;
        void operator%= (const valarray<T>&) const;
        void operator+= (const valarray<T>&) const;
        void operator-= (const valarray<T>&) const;
        void operator^= (const valarray<T>&) const;
        void operator&= (const valarray<T>&) const;
        void operator|= (const valarray<T>&) const;
        void operator<<= (const valarray<T>&) const;
        void operator>>= (const valarray<T>&) const;

        slice_array(const slice_array&);
        ~slice_array();
        const slice_array& operator=(const slice_array&) const;
        void operator=(const T&) const;

        slice_array() = delete; // as implied by declaring copy constructor above
    };
}
```

This template is a helper template used by the `slice` subscript operator

```
slice_array<T> valarray<T>::operator[](slice);
```

It has reference semantics to a subset of an array specified by a `slice` object.

EXAMPLE The expression `a[slice(1, 5, 3)] = b;` has the effect of assigning the elements of `b` to a slice of the elements in `a`. For the slice shown, the elements selected from `a` are 1, 4, ..., 13.

**28.6.5.2 Assignment**

[slice.arr.assign]

```
void operator=(const valarray<T>&) const;
const slice_array& operator=(const slice_array&) const;
```

These assignment operators have reference semantics, assigning the values of the argument array elements to selected elements of the `valarray<T>` object to which the `slice_array` object refers.

**28.6.5.3 Compound assignment**

[slice.arr.comp.assign]

```
void operator*= (const valarray<T>&) const;
void operator/= (const valarray<T>&) const;
void operator%= (const valarray<T>&) const;
void operator+= (const valarray<T>&) const;
void operator-= (const valarray<T>&) const;
```

```

void operator^= (const valarray<T>&) const;
void operator&= (const valarray<T>&) const;
void operator|= (const valarray<T>&) const;
void operator<=<= (const valarray<T>&) const;
void operator>>= (const valarray<T>&) const;

```

These compound assignments have reference semantics, applying the indicated operation to the elements of the argument array and selected elements of the `valarray<T>` object to which the `slice_array` object refers.

#### 28.6.5.4 Fill function

[`slice.arr.fill`]

```
void operator=(const T&) const;
```

This function has reference semantics, assigning the value of its argument to the elements of the `valarray<T>` object to which the `slice_array` object refers.

### 28.6.6 The `gslice` class

[`class.gslice`]

#### 28.6.6.1 Overview

[`class.gslice.overview`]

```

namespace std {
    class gslice {
    public:
        gslice();
        gslice(size_t s, const valarray<size_t>& l, const valarray<size_t>& d);

        size_t      start() const;
        valarray<size_t> size() const;
        valarray<size_t> stride() const;
    };
}

```

This class represents a generalized slice out of an array. A `gslice` is defined by a starting offset ( $s$ ), a set of lengths ( $l_j$ ), and a set of strides ( $d_j$ ). The number of lengths shall equal the number of strides.

A `gslice` represents a mapping from a set of indices ( $i_j$ ), equal in number to the number of strides, to a single index  $k$ . It is useful for building multidimensional array classes using the `valarray` template, which is one-dimensional. The set of one-dimensional index values specified by a `gslice` are

$$k = s + \sum_j i_j d_j$$

where the multidimensional indices  $i_j$  range in value from 0 to  $l_{ij} - 1$ .

EXAMPLE 1 The `gslice` specification

```

start = 3
length = {2, 4, 3}
stride = {19, 4, 1}

```

yields the sequence of one-dimensional indices

$$k = 3 + (0, 1) \times 19 + (0, 1, 2, 3) \times 4 + (0, 1, 2) \times 1$$

which are ordered as shown in the following table:

| $(i_0, i_1, i_2, k)$ | = |
|----------------------|---|
| (0, 0, 0, 3),        |   |
| (0, 0, 1, 4),        |   |
| (0, 0, 2, 5),        |   |
| (0, 1, 0, 7),        |   |
| (0, 1, 1, 8),        |   |
| (0, 1, 2, 9),        |   |
| (0, 2, 0, 11),       |   |
| (0, 2, 1, 12),       |   |
| (0, 2, 2, 13),       |   |
| (0, 3, 0, 15),       |   |
| (0, 3, 1, 16),       |   |

```
(0, 3, 2, 17),
(1, 0, 0, 22),
(1, 0, 1, 23),
...
(1, 3, 2, 36)
```

That is, the highest-ordered index turns fastest.

It is possible to have degenerate generalized slices in which an address is repeated.

EXAMPLE 2 If the stride parameters in the previous example are changed to {1, 1, 1}, the first few elements of the resulting sequence of indices will be

```
(0, 0, 0, 3),
(0, 0, 1, 4),
(0, 0, 2, 5),
(0, 1, 0, 4),
(0, 1, 1, 5),
(0, 1, 2, 6),
...
```

If a degenerate slice is used as the argument to the non-const version of operator[] (const gslice&), the behavior is undefined.

### 28.6.6.2 Constructors

[gslice.cons]

```
gslice();
gslice(size_t start, const valarray<size_t>& lengths,
       const valarray<size_t>& strides);
```

The default constructor is equivalent to `gslice(0, valarray<size_t>(), valarray<size_t>())`. The constructor with arguments builds a `gslice` based on a specification of start, lengths, and strides, as explained in the previous subclause.

### 28.6.6.3 Access functions

[gslice.access]

```
size_t      start() const;
valarray<size_t> size() const;
valarray<size_t> stride() const;
```

*Returns:* The representation of the start, lengths, or strides specified for the `gslice`.

*Complexity:* `start()` is constant time. `size()` and `stride()` are linear in the number of strides.

## 28.6.7 Class template `gslice_array`

[template.gslice.array]

### 28.6.7.1 Overview

[template.gslice.array.overview]

```
namespace std {
    template<class T> class gslice_array {
    public:
        using value_type = T;

        void operator= (const valarray<T>&) const;
        void operator*= (const valarray<T>&) const;
        void operator/= (const valarray<T>&) const;
        void operator%=(const valarray<T>&) const;
        void operator+=(const valarray<T>&) const;
        void operator-=(const valarray<T>&) const;
        void operator^=(const valarray<T>&) const;
        void operator&=(const valarray<T>&) const;
        void operator|=(const valarray<T>&) const;
        void operator<<=(const valarray<T>&) const;
        void operator>>=(const valarray<T>&) const;

        gslice_array(const gslice_array&);
        ~gslice_array();
        const gslice_array& operator=(const gslice_array&) const;
        void operator=(const T&) const;
```

```

    gslice_array() = delete;    // as implied by declaring copy constructor above
};
}

```

This template is a helper template used by the `gslice` subscript operator

```
gslice_array<T> valarray<T>::operator[](const gslice&);
```

It has reference semantics to a subset of an array specified by a `gslice` object. Thus, the expression `a[gslice(1, length, stride)] = b` has the effect of assigning the elements of `b` to a generalized slice of the elements in `a`.

### 28.6.7.2 Assignment

[gslice.array.assign]

```
void operator=(const valarray<T>&) const;
const gslice_array& operator=(const gslice_array&) const;
```

These assignment operators have reference semantics, assigning the values of the argument array elements to selected elements of the `valarray<T>` object to which the `gslice_array` refers.

### 28.6.7.3 Compound assignment

[gslice.array.comp.assign]

```
void operator*= (const valarray<T>&) const;
void operator/= (const valarray<T>&) const;
void operator%= (const valarray<T>&) const;
void operator+= (const valarray<T>&) const;
void operator-= (const valarray<T>&) const;
void operator^= (const valarray<T>&) const;
void operator&= (const valarray<T>&) const;
void operator|= (const valarray<T>&) const;
void operator<<= (const valarray<T>&) const;
void operator>>= (const valarray<T>&) const;
```

These compound assignments have reference semantics, applying the indicated operation to the elements of the argument array and selected elements of the `valarray<T>` object to which the `gslice_array` object refers.

### 28.6.7.4 Fill function

[gslice.array.fill]

```
void operator=(const T&) const;
```

This function has reference semantics, assigning the value of its argument to the elements of the `valarray<T>` object to which the `gslice_array` object refers.

## 28.6.8 Class template `mask_array`

[template.mask.array]

### 28.6.8.1 Overview

[template.mask.array.overview]

```

namespace std {
    template<class T> class mask_array {
    public:
        using value_type = T;

        void operator= (const valarray<T>&) const;
        void operator*= (const valarray<T>&) const;
        void operator/= (const valarray<T>&) const;
        void operator%= (const valarray<T>&) const;
        void operator+= (const valarray<T>&) const;
        void operator-= (const valarray<T>&) const;
        void operator^= (const valarray<T>&) const;
        void operator&= (const valarray<T>&) const;
        void operator|= (const valarray<T>&) const;
        void operator<<= (const valarray<T>&) const;
        void operator>>= (const valarray<T>&) const;

        mask_array(const mask_array&);
        ~mask_array();
        const mask_array& operator=(const mask_array&) const;
        void operator=(const T&) const;
    };
}

```

```

    mask_array() = delete;    // as implied by declaring copy constructor above
};
}

```

This template is a helper template used by the mask subscript operator:

```
mask_array<T> valarray<T>::operator[] (const valarray<bool>&);
```

It has reference semantics to a subset of an array specified by a boolean mask. Thus, the expression `a[mask] = b;` has the effect of assigning the elements of `b` to the masked elements in `a` (those for which the corresponding element in `mask` is true).

### 28.6.8.2 Assignment

[mask.array.assign]

```

void operator=(const valarray<T>&) const;
const mask_array& operator=(const mask_array&) const;

```

These assignment operators have reference semantics, assigning the values of the argument array elements to selected elements of the `valarray<T>` object to which the `mask_array` object refers.

### 28.6.8.3 Compound assignment

[mask.array.comp.assign]

```

void operator*= (const valarray<T>&) const;
void operator/= (const valarray<T>&) const;
void operator%= (const valarray<T>&) const;
void operator+= (const valarray<T>&) const;
void operator-= (const valarray<T>&) const;
void operator^= (const valarray<T>&) const;
void operator&= (const valarray<T>&) const;
void operator|= (const valarray<T>&) const;
void operator<<= (const valarray<T>&) const;
void operator>>= (const valarray<T>&) const;

```

These compound assignments have reference semantics, applying the indicated operation to the elements of the argument array and selected elements of the `valarray<T>` object to which the `mask_array` object refers.

### 28.6.8.4 Fill function

[mask.array.fill]

```
void operator=(const T&) const;
```

This function has reference semantics, assigning the value of its argument to the elements of the `valarray<T>` object to which the `mask_array` object refers.

## 28.6.9 Class template `indirect_array`

[template.indirect.array]

### 28.6.9.1 Overview

[template.indirect.array.overview]

```

namespace std {
    template<class T> class indirect_array {
    public:
        using value_type = T;

        void operator= (const valarray<T>&) const;
        void operator*= (const valarray<T>&) const;
        void operator/= (const valarray<T>&) const;
        void operator%= (const valarray<T>&) const;
        void operator+= (const valarray<T>&) const;
        void operator-= (const valarray<T>&) const;
        void operator^= (const valarray<T>&) const;
        void operator&= (const valarray<T>&) const;
        void operator|= (const valarray<T>&) const;
        void operator<<= (const valarray<T>&) const;
        void operator>>= (const valarray<T>&) const;

        indirect_array(const indirect_array&);
        ~indirect_array();
        const indirect_array& operator=(const indirect_array&) const;
        void operator=(const T&) const;
    };
}

```

```

    indirect_array() = delete; // as implied by declaring copy constructor above
};
}

```

This template is a helper template used by the indirect subscript operator

```
indirect_array<T> valarray<T>::operator[](const valarray<size_t>&);
```

It has reference semantics to a subset of an array specified by an `indirect_array`. Thus, the expression `a[indirect] = b;` has the effect of assigning the elements of `b` to the elements in `a` whose indices appear in `indirect`.

### 28.6.9.2 Assignment

[indirect.array.assign]

```
void operator=(const valarray<T>&) const;
const indirect_array& operator=(const indirect_array&) const;
```

These assignment operators have reference semantics, assigning the values of the argument array elements to selected elements of the `valarray<T>` object to which it refers.

If the `indirect_array` specifies an element in the `valarray<T>` object to which it refers more than once, the behavior is undefined.

EXAMPLE

```

int addr[] = {2, 3, 1, 4, 4};
valarray<size_t> indirect(addr, 5);
valarray<double> a(0., 10), b(1., 5);
a[indirect] = b;

```

results in undefined behavior since element 4 is specified twice in the indirection.

### 28.6.9.3 Compound assignment

[indirect.array.comp.assign]

```

void operator*= (const valarray<T>&) const;
void operator/= (const valarray<T>&) const;
void operator%= (const valarray<T>&) const;
void operator+= (const valarray<T>&) const;
void operator-= (const valarray<T>&) const;
void operator^= (const valarray<T>&) const;
void operator&= (const valarray<T>&) const;
void operator|= (const valarray<T>&) const;
void operator<<= (const valarray<T>&) const;
void operator>>= (const valarray<T>&) const;

```

These compound assignments have reference semantics, applying the indicated operation to the elements of the argument array and selected elements of the `valarray<T>` object to which the `indirect_array` object refers.

If the `indirect_array` specifies an element in the `valarray<T>` object to which it refers more than once, the behavior is undefined.

### 28.6.9.4 Fill function

[indirect.array.fill]

```
void operator=(const T&) const;
```

This function has reference semantics, assigning the value of its argument to the elements of the `valarray<T>` object to which the `indirect_array` object refers.

### 28.6.10 valarray range access

[valarray.range]

In the `begin` and `end` function templates that follow, *unspecified1* is a type that meets the requirements of a mutable *Cpp17RandomAccessIterator* (25.3.5.7) and models *contiguous\_iterator* (25.3.4.14), whose *value\_type* is the template parameter `T` and whose *reference type* is `T&`. *unspecified2* is a type that meets the requirements of a constant *Cpp17RandomAccessIterator* and models *contiguous\_iterator*, whose *value\_type* is the template parameter `T` and whose *reference type* is `const T&`.

The iterators returned by `begin` and `end` for an array are guaranteed to be valid until the member function `resize(size_t, T)` (28.6.2.8) is called for that array or until the lifetime of that array ends, whichever happens first.

```
template<class T> unspecified1 begin(valarray<T>& v);
template<class T> unspecified2 begin(const valarray<T>& v);
```

*Returns:* An iterator referencing the first value in the array.

```
template<class T> unspecified1 end(valarray<T>& v);
template<class T> unspecified2 end(const valarray<T>& v);
```

*Returns:* An iterator referencing one past the last value in the array.

## 28.7 Mathematical functions for floating-point types

long double sph_neumannl(unsigned n, long double x);
}

```

The contents and meaning of the header `<cmath>` are the same as the C standard library header `<math.h>`, with the addition of a three-dimensional hypotenuse function (28.7.3), a linear interpolation function (28.7.4), and the mathematical special functions described in 28.7.6.

NOTE Several functions have additional overloads in this document, but they have the same behavior as in the C standard library (16.2).

For each function with at least one parameter of type *floating-point-type*, the implementation provides an overload for each cv-unqualified floating-point type (6.8.2) where all uses of *floating-point-type* in the function signature are replaced with that floating-point type.

For each function with at least one parameter of type *floating-point-type* other than `abs`, the implementation also provides additional overloads sufficient to ensure that, if every argument corresponding to a *floating-point-type* parameter has arithmetic type, then every such argument is effectively cast to the floating-point type with the greatest floating-point conversion rank and greatest floating-point conversion subrank among the types of all such arguments, where arguments of integer type are considered to have the same floating-point conversion rank as `double`. If no such floating-point type with the greatest rank and subrank exists, then overload resolution does not result in a usable candidate (12.2.1) from the overloads provided by the implementation.

An invocation of `nexttoward` is ill-formed if the argument corresponding to the *floating-point-type* parameter has extended floating-point type.

See also ISO/IEC 9899:2018, 7.12.

## 28.7.2 Absolute values

[c.math.abs]

NOTE 1 The headers `<cstdlib>` (17.2.2) and `<cmath>` (28.7.1) declare the functions described in this subclause.

```

constexpr int abs(int j);
constexpr long int abs(long int j);
constexpr long long int abs(long long int j);

```

*Effects:* These functions have the semantics specified in the C standard library for the functions `abs`, `labs`, and `llabs`, respectively.

*Remarks:* If `abs` is called with an argument of type `X` for which `is_unsigned_v<X>` is `true` and if `X` cannot be converted to `int` by integral promotion (7.3.7), the program is ill-formed.

NOTE 2 Allowing arguments that can be promoted to `int` provides compatibility with C.

```

constexpr floating-point-type abs(floating-point-type x);

```

*Returns:* The absolute value of `x`.

See also ISO/IEC 9899:2018, 7.12.7.2, 7.22.6.1.

**28.7.3 Three-dimensional hypotenuse****[c.math.hypot3]**

*floating-point-type* hypot(*floating-point-type* x, *floating-point-type* y, *floating-point-type* z);

Returns:  $\sqrt{x^2 + y^2 + z^2}$ .

**28.7.4 Linear interpolation****[c.math.lerp]**

constexpr *floating-point-type* lerp(*floating-point-type* a, *floating-point-type* b,  
*floating-point-type* t) noexcept;

Returns:  $a + t(b - a)$ .

Remarks: Let r be the value returned. If isfinite(a) && isfinite(b), then:

- If t == 0, then r == a.
- If t == 1, then r == b.
- If t >= 0 && t <= 1, then isfinite(r).
- If isfinite(t) && a == b, then r == a.
- If isfinite(t) || !isnan(t) && b-a != 0, then !isnan(r).

Let CMP(x,y) be 1 if x > y, -1 if x < y, and 0 otherwise. For any t1 and t2, the product of CMP(lerp(a, b, t2), lerp(a, b, t1)), CMP(t2, t1), and CMP(b, a) is non-negative.

**28.7.5 Classification / comparison functions****[c.math.fpclass]**

The classification / comparison functions behave the same as the C macros with the corresponding names defined in the C standard library.

See also ISO/IEC 9899:2018, 7.12.3, 7.12.4.

**28.7.6 Mathematical special functions****[sf.cmath]****28.7.6.1 General****[sf.cmath.general]**

If any argument value to any of the functions specified in 28.7.6 is a NaN (Not a Number), the function shall return a NaN but it shall not report a domain error. Otherwise, the function shall report a domain error for just those argument values for which:

- the function description's Returns: element explicitly specifies a domain and those argument values fall outside the specified domain, or
- the corresponding mathematical function value has a nonzero imaginary component, or
- the corresponding mathematical function is not mathematically defined.<sup>238</sup>

Unless otherwise specified, each function is defined for all finite values, for negative infinity, and for positive infinity.

**28.7.6.2 Associated Laguerre polynomials****[sf.cmath.assoc.laguerre]**

*floating-point-type* assoc\_laguerre(unsigned n, unsigned m, *floating-point-type* x);

float assoc\_laguerref(unsigned n, unsigned m, float x);

long double assoc\_laguerrel(unsigned n, unsigned m, long double x);

Effects: These functions compute the associated Laguerre polynomials of their respective arguments n, m, and x.

Returns:  $L_n^m(x)$ , where  $L_n^m$  is given by Formula 28.22, n is n, m is m, and x is x.

$$L_n^m(x) = (-1)^m \frac{d^m}{dx^m} L_{n+m}(x), \quad \text{for } x \geq 0 \quad (28.22)$$

Remarks: The effect of calling each of these functions is implementation-defined if n >= 128 or if m >= 128.

<sup>238</sup> A mathematical function is mathematically defined for a given set of argument values (a) if it is explicitly defined for that set of argument values, or (b) if its limiting value exists and does not depend on the direction of approach.

**28.7.6.3 Associated Legendre functions****[sf.cmath.assoc.legendre]**

*floating-point-type* `assoc_legendre(unsigned l, unsigned m, floating-point-type x);`  
 float `assoc_legendref(unsigned l, unsigned m, float x);`  
 long double `assoc_legendrel(unsigned l, unsigned m, long double x);`

*Effects:* These functions compute the associated Legendre functions of their respective arguments  $l$ ,  $m$ , and  $x$ .

*Returns:*  $P_\ell^m(x)$ , where  $P_\ell^m$  is given by Formula 28.23,  $l$  is  $l$ ,  $m$  is  $m$ , and  $x$  is  $x$ .

$$P_\ell^m(x) = (1 - x^2)^{m/2} \frac{d^m}{dx^m} P_\ell(x), \quad \text{for } |x| \leq 1 \quad (28.23)$$

*Remarks:* The effect of calling each of these functions is implementation-defined if  $l \geq 128$ .

**28.7.6.4 Beta function****[sf.cmath.beta]**

*floating-point-type* `beta(floating-point-type x, floating-point-type y);`  
 float `betaf(float x, float y);`  
 long double `betal(long double x, long double y);`

*Effects:* These functions compute the beta function of their respective arguments  $x$  and  $y$ .

*Returns:*  $B(x, y)$ , where  $B$  is given by Formula 28.24,  $x$  is  $x$  and  $y$  is  $y$ .

$$B(x, y) = \frac{\Gamma(x)\Gamma(y)}{\Gamma(x+y)}, \quad \text{for } x > 0, y > 0 \quad (28.24)$$

**28.7.6.5 Complete elliptic integral of the first kind****[sf.cmath.comp.ellint.1]**

*floating-point-type* `comp_ellint_1(floating-point-type k);`  
 float `comp_ellint_1f(float k);`  
 long double `comp_ellint_1l(long double k);`

*Effects:* These functions compute the complete elliptic integral of the first kind of their respective arguments  $k$ .

*Returns:*  $K(k)$ , where  $K$  is given by Formula 28.25 and  $k$  is  $k$ .

$$K(k) = F(k, \pi/2), \quad \text{for } |k| \leq 1 \quad (28.25)$$

See also 28.7.6.12.

**28.7.6.6 Complete elliptic integral of the second kind****[sf.cmath.comp.ellint.2]**

*floating-point-type* `comp_ellint_2(floating-point-type k);`  
 float `comp_ellint_2f(float k);`  
 long double `comp_ellint_2l(long double k);`

*Effects:* These functions compute the complete elliptic integral of the second kind of their respective arguments  $k$ .

*Returns:*  $E(k)$ , where  $E$  is given by Formula 28.26 and  $k$  is  $k$ .

$$E(k) = E(k, \pi/2), \quad \text{for } |k| \leq 1 \quad (28.26)$$

See also 28.7.6.13.

**28.7.6.7 Complete elliptic integral of the third kind****[sf.cmath.comp.ellint.3]**

*floating-point-type* `comp_ellint_3(floating-point-type k, floating-point-type nu);`  
 float `comp_ellint_3f(float k, float nu);`  
 long double `comp_ellint_3l(long double k, long double nu);`

*Effects:* These functions compute the complete elliptic integral of the third kind of their respective arguments  $k$  and  $\nu$ .

*Returns:*  $\Pi(\nu, k)$ , where  $\Pi$  is given by Formula 28.27,  $k$  is  $k$ , and  $\nu$  is  $\nu$ .

$$\Pi(\nu, k) = \Pi(\nu, k, \pi/2), \quad \text{for } |k| \leq 1 \quad (28.27)$$

See also 28.7.6.14.

**28.7.6.8 Regular modified cylindrical Bessel functions****[sf.cmath.cyl.bessel.i]**

```
floating-point-type cyl_bessel_i(floating-point-type nu, floating-point-type x);
float cyl_bessel_if(float nu, float x);
long double cyl_bessel_il(long double nu, long double x);
```

*Effects:* These functions compute the regular modified cylindrical Bessel functions of their respective arguments *nu* and *x*.

*Returns:*  $I_\nu(x)$ , where  $I_\nu$  is given by Formula 28.28,  $\nu$  is *nu*, and *x* is *x*.

$$I_\nu(x) = i^{-\nu} J_\nu(ix) = \sum_{k=0}^{\infty} \frac{(x/2)^{\nu+2k}}{k! \Gamma(\nu+k+1)}, \quad \text{for } x \geq 0 \quad (28.28)$$

*Remarks:* The effect of calling each of these functions is implementation-defined if *nu*  $\geq$  128.

See also 28.7.6.9.

**28.7.6.9 Cylindrical Bessel functions of the first kind****[sf.cmath.cyl.bessel.j]**

```
floating-point-type cyl_bessel_j(floating-point-type nu, floating-point-type x);
float cyl_bessel_jf(float nu, float x);
long double cyl_bessel_jl(long double nu, long double x);
```

*Effects:* These functions compute the cylindrical Bessel functions of the first kind of their respective arguments *nu* and *x*.

*Returns:*  $J_\nu(x)$ , where  $J_\nu$  is given by Formula 28.29,  $\nu$  is *nu*, and *x* is *x*.

$$J_\nu(x) = \sum_{k=0}^{\infty} \frac{(-1)^k (x/2)^{\nu+2k}}{k! \Gamma(\nu+k+1)}, \quad \text{for } x \geq 0 \quad (28.29)$$

*Remarks:* The effect of calling each of these functions is implementation-defined if *nu*  $\geq$  128.

**28.7.6.10 Irregular modified cylindrical Bessel functions****[sf.cmath.cyl.bessel.k]**

```
floating-point-type cyl_bessel_k(floating-point-type nu, floating-point-type x);
float cyl_bessel_kf(float nu, float x);
long double cyl_bessel_kl(long double nu, long double x);
```

*Effects:* These functions compute the irregular modified cylindrical Bessel functions of their respective arguments *nu* and *x*.

*Returns:*  $K_\nu(x)$ , where  $K_\nu$  is given by Formula 28.30,  $\nu$  is *nu*, and *x* is *x*.

$$K_\nu(x) = (\pi/2) i^{\nu+1} (J_\nu(ix) + i N_\nu(ix)) = \begin{cases} \frac{\pi}{2} \frac{I_{-\nu}(x) - I_\nu(x)}{\sin \nu\pi}, & \text{for } x \geq 0 \text{ and non-integral } \nu \\ \frac{\pi}{2} \lim_{\mu \rightarrow \nu} \frac{I_{-\mu}(x) - I_\mu(x)}{\sin \mu\pi}, & \text{for } x \geq 0 \text{ and integral } \nu \end{cases} \quad (28.30)$$

*Remarks:* The effect of calling each of these functions is implementation-defined if *nu*  $\geq$  128.

See also 28.7.6.8, 28.7.6.9, 28.7.6.11.

**28.7.6.11 Cylindrical Neumann functions****[sf.cmath.cyl.neumann]**

```
floating-point-type cyl_neumann(floating-point-type nu, floating-point-type x);
float cyl_neumannf(float nu, float x);
long double cyl_neumannl(long double nu, long double x);
```

*Effects:* These functions compute the cylindrical Neumann functions, also known as the cylindrical Bessel functions of the second kind, of their respective arguments *nu* and *x*.

*Returns:*  $N_\nu(x)$ , where  $N_\nu$  is given by Formula 28.31,  $\nu$  is *nu*, and *x* is *x*.

$$N_\nu(x) = \begin{cases} \frac{J_\nu(x) \cos \nu\pi - J_{-\nu}(x)}{\sin \nu\pi}, & \text{for } x \geq 0 \text{ and non-integral } \nu \\ \lim_{\mu \rightarrow \nu} \frac{J_\mu(x) \cos \mu\pi - J_{-\mu}(x)}{\sin \mu\pi}, & \text{for } x \geq 0 \text{ and integral } \nu \end{cases} \quad (28.31)$$

*Remarks:* The effect of calling each of these functions is implementation-defined if  $\text{nu} \geq 128$ .

See also 28.7.6.9.

### 28.7.6.12 Incomplete elliptic integral of the first kind [sf.cmath.ellint.1]

```
floating-point-type ellint_1(floating-point-type k, floating-point-type phi);
float ellint_1f(float k, float phi);
long double ellint_1l(long double k, long double phi);
```

*Effects:* These functions compute the incomplete elliptic integral of the first kind of their respective arguments  $k$  and  $\phi$  ( $\phi$  measured in radians).

*Returns:*  $F(k, \phi)$ , where  $F$  is given by Formula 28.32,  $k$  is  $k$ , and  $\phi$  is  $\phi$ .

$$F(k, \phi) = \int_0^\phi \frac{d\theta}{\sqrt{1 - k^2 \sin^2 \theta}}, \quad \text{for } |k| \leq 1 \quad (28.32)$$

### 28.7.6.13 Incomplete elliptic integral of the second kind [sf.cmath.ellint.2]

```
floating-point-type ellint_2(floating-point-type k, floating-point-type phi);
float ellint_2f(float k, float phi);
long double ellint_2l(long double k, long double phi);
```

*Effects:* These functions compute the incomplete elliptic integral of the second kind of their respective arguments  $k$  and  $\phi$  ( $\phi$  measured in radians).

*Returns:*  $E(k, \phi)$ , where  $E$  is given by Formula 28.33,  $k$  is  $k$ , and  $\phi$  is  $\phi$ .

$$E(k, \phi) = \int_0^\phi \sqrt{1 - k^2 \sin^2 \theta} d\theta, \quad \text{for } |k| \leq 1 \quad (28.33)$$

### 28.7.6.14 Incomplete elliptic integral of the third kind [sf.cmath.ellint.3]

```
floating-point-type ellint_3(floating-point-type k, floating-point-type nu,
                             floating-point-type phi);
float ellint_3f(float k, float nu, float phi);
long double ellint_3l(long double k, long double nu, long double phi);
```

*Effects:* These functions compute the incomplete elliptic integral of the third kind of their respective arguments  $k$ ,  $\nu$ , and  $\phi$  ( $\phi$  measured in radians).

*Returns:*  $\Pi(\nu, k, \phi)$ , where  $\Pi$  is given by Formula 28.34,  $\nu$  is  $\nu$ ,  $k$  is  $k$ , and  $\phi$  is  $\phi$ .

$$\Pi(\nu, k, \phi) = \int_0^\phi \frac{d\theta}{(1 - \nu \sin^2 \theta) \sqrt{1 - k^2 \sin^2 \theta}}, \quad \text{for } |k| \leq 1 \quad (28.34)$$

### 28.7.6.15 Exponential integral [sf.cmath.expint]

```
floating-point-type expint(floating-point-type x);
float expintf(float x);
long double expintl(long double x);
```

*Effects:* These functions compute the exponential integral of their respective arguments  $x$ .

*Returns:*  $Ei(x)$ , where  $Ei$  is given by Formula 28.35 and  $x$  is  $x$ .

$$Ei(x) = - \int_{-x}^{\infty} \frac{e^{-t}}{t} dt \quad (28.35)$$

### 28.7.6.16 Hermite polynomials [sf.cmath.hermite]

```
floating-point-type hermite(unsigned n, floating-point-type x);
float hermitef(unsigned n, float x);
long double hermitel(unsigned n, long double x);
```

*Effects:* These functions compute the Hermite polynomials of their respective arguments  $n$  and  $x$ .

*Returns:*  $H_n(x)$ , where  $H_n$  is given by Formula 28.36,  $n$  is  $n$ , and  $x$  is  $x$ .

$$H_n(x) = (-1)^n e^{x^2} \frac{d^n}{dx^n} e^{-x^2} \quad (28.36)$$

*Remarks:* The effect of calling each of these functions is implementation-defined if  $n \geq 128$ .

**28.7.6.17 Laguerre polynomials****[sf.cmath.laguerre]**

```
floating-point-type laguerre(unsigned n, floating-point-type x);
float laguerref(unsigned n, float x);
long double laguerrel(unsigned n, long double x);
```

*Effects:* These functions compute the Laguerre polynomials of their respective arguments **n** and **x**.

*Returns:*  $L_n(x)$ , where  $L_n$  is given by Formula 28.37,  $n$  is **n**, and  $x$  is **x**.

$$L_n(x) = \frac{e^x}{n!} \frac{d^n}{dx^n} (x^n e^{-x}), \quad \text{for } x \geq 0 \quad (28.37)$$

*Remarks:* The effect of calling each of these functions is implementation-defined if **n**  $\geq$  128.

**28.7.6.18 Legendre polynomials****[sf.cmath.legendre]**

```
floating-point-type legendre(unsigned l, floating-point-type x);
float legendref(unsigned l, float x);
long double legendrel(unsigned l, long double x);
```

*Effects:* These functions compute the Legendre polynomials of their respective arguments **l** and **x**.

*Returns:*  $P_l(x)$ , where  $P_l$  is given by Formula 28.38,  $l$  is **l**, and  $x$  is **x**.

$$P_l(x) = \frac{1}{2^l l!} \frac{d^l}{dx^l} (x^2 - 1)^l, \quad \text{for } |x| \leq 1 \quad (28.38)$$

*Remarks:* The effect of calling each of these functions is implementation-defined if **l**  $\geq$  128.

**28.7.6.19 Riemann zeta function****[sf.cmath.riemann.zeta]**

```
floating-point-type riemann_zeta(floating-point-type x);
float riemann_zetaf(float x);
long double riemann_zetal(long double x);
```

*Effects:* These functions compute the Riemann zeta function of their respective arguments **x**.

*Returns:*  $\zeta(x)$ , where  $\zeta$  is given by Formula 28.39 and  $x$  is **x**.

$$\zeta(x) = \begin{cases} \sum_{k=1}^{\infty} k^{-x}, & \text{for } x > 1 \\ \frac{1}{1 - 2^{1-x}} \sum_{k=1}^{\infty} (-1)^{k-1} k^{-x}, & \text{for } 0 \leq x \leq 1 \\ 2^x \pi^{x-1} \sin\left(\frac{\pi x}{2}\right) \Gamma(1-x) \zeta(1-x), & \text{for } x < 0 \end{cases} \quad (28.39)$$

**28.7.6.20 Spherical Bessel functions of the first kind****[sf.cmath.sph.bessel]**

```
floating-point-type sph_bessel(unsigned n, floating-point-type x);
float sph_besself(unsigned n, float x);
long double sph_bessell(unsigned n, long double x);
```

*Effects:* These functions compute the spherical Bessel functions of the first kind of their respective arguments **n** and **x**.

*Returns:*  $j_n(x)$ , where  $j_n$  is given by Formula 28.40,  $n$  is **n**, and  $x$  is **x**.

$$j_n(x) = (\pi/2x)^{1/2} J_{n+1/2}(x), \quad \text{for } x \geq 0 \quad (28.40)$$

*Remarks:* The effect of calling each of these functions is implementation-defined if **n**  $\geq$  128.

See also 28.7.6.9.

**28.7.6.21 Spherical associated Legendre functions**

[sf.cmath.sph.legendre]

```
floating-point-type sph_legendre(unsigned l, unsigned m, floating-point-type theta);
float sph_legendref(unsigned l, unsigned m, float theta);
long double sph_legendrel(unsigned l, unsigned m, long double theta);
```

*Effects:* These functions compute the spherical associated Legendre functions of their respective arguments *l*, *m*, and *theta* (*theta* measured in radians).

*Returns:*  $Y_\ell^m(\theta, 0)$ , where  $Y_\ell^m$  is given by Formula 28.41, *l* is *l*, *m* is *m*, and  $\theta$  is *theta*.

$$Y_\ell^m(\theta, \phi) = (-1)^m \left[ \frac{(2\ell + 1)(\ell - m)!}{4\pi(\ell + m)!} \right]^{1/2} P_\ell^m(\cos \theta) e^{im\phi}, \quad \text{for } |m| \leq \ell \quad (28.41)$$

*Remarks:* The effect of calling each of these functions is implementation-defined if *l*  $\geq$  128.

See also 28.7.6.3.

**28.7.6.22 Spherical Neumann functions**

[sf.cmath.sph.neumann]

```
floating-point-type sph_neumann(unsigned n, floating-point-type x);
float sph_neumannf(unsigned n, float x);
long double sph_neumannl(unsigned n, long double x);
```

*Effects:* These functions compute the spherical Neumann functions, also known as the spherical Bessel functions of the second kind, of their respective arguments *n* and *x*.

*Returns:*  $n_n(x)$ , where  $n_n$  is given by Formula 28.42, *n* is *n*, and *x* is *x*.

$$n_n(x) = (\pi/2x)^{1/2} N_{n+1/2}(x) \quad \text{for } x \geq 0 \quad (28.42)$$

*Remarks:* The effect of calling each of these functions is implementation-defined if *n*  $\geq$  128.

See also 28.7.6.11.

**28.8 Numbers**

[numbers]

### 28.8.2 Mathematical constants

[math.constants]

The library-defined partial specializations of mathematical constant variable templates are initialized with the nearest representable values of  $e$ ,  $\log_2 e$ ,  $\log_{10} e$ ,  $\pi$ ,  $\frac{1}{\pi}$ ,  $\frac{1}{\sqrt{\pi}}$ ,  $\ln 2$ ,  $\ln 10$ ,  $\sqrt{2}$ ,  $\sqrt{3}$ ,  $\frac{1}{\sqrt{3}}$ , the Euler-Mascheroni  $\gamma$  constant, and the golden ratio  $\phi$  constant  $\frac{1+\sqrt{5}}{2}$ , respectively.

Pursuant to 16.4.5.2.1, a program may partially or explicitly specialize a mathematical constant variable template provided that the specialization depends on a program-defined type.

A program that instantiates a primary template of a mathematical constant variable template is ill-formed.

## 29 Time library

[time]

### 29.1 General

[time.general]

This Clause describes the chrono library (29.2) and various C functions (29.14) that provide generally useful time utilities, as summarized in Table 98.

Table 98 — Time library summary [tab:time.summary]

| Subclause | Header                           |
|-----------|----------------------------------|
| 29.3      | <i>Cpp17Clock</i> requirements   |
| 29.4      | Time-related traits <chrono>     |
| 29.5      | Class template duration          |
| 29.6      | Class template time_point        |
| 29.7      | Clocks                           |
| 29.8      | Civil calendar                   |
| 29.9      | Class template hh_mm_ss          |
| 29.10     | 12/24 hour functions             |
| 29.11     | Time zones                       |
| 29.12     | Formatting                       |
| 29.13     | Parsing                          |
| 29.14     | C library time utilities <ctime> |

Let *STATICALLY-WIDEN*<charT>("...") be "..." if charT is char and L"..." if charT is wchar\_t.

### 29.2 Header <chrono> synopsis

### 29.3 Cpp17Clock requirements [time.clock.req]

A clock is a bundle consisting of a `duration`, a `time_point`, and a function `now()` to get the current `time_point`. The origin of the clock's `time_point` is referred to as the clock's *epoch*. A clock shall meet the requirements in Table 99.

In Table 99 C1 and C2 denote clock types. `t1` and `t2` are values returned by `C1::now()` where the call returning `t1` happens before (6.9.2) the call returning `t2` and both of these calls occur before `C1::time_point::max()`.

NOTE 1 This means C1 did not wrap around between `t1` and `t2`.

Table 99 — Cpp17Clock requirements [tab:time.clock]

| Expression                  | Return type                                                                                          | Operational semantics                                                                                                                                  |
|-----------------------------|------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>C1::rep</code>        | An arithmetic type or a class emulating an arithmetic type                                           | The representation type of <code>C1::duration</code> .                                                                                                 |
| <code>C1::period</code>     | a specialization of <code>ratio</code>                                                               | The tick period of the clock in seconds.                                                                                                               |
| <code>C1::duration</code>   | <code>chrono::duration&lt;C1::rep, C1::period&gt;</code>                                             | The <code>duration</code> type of the clock.                                                                                                           |
| <code>C1::time_point</code> | <code>chrono::time_point&lt;C1&gt;</code> or <code>chrono::time_point&lt;C2, C1::duration&gt;</code> | The <code>time_point</code> type of the clock. C1 and C2 shall refer to the same epoch.                                                                |
| <code>C1::is_steady</code>  | <code>const bool</code>                                                                              | <code>true</code> if <code>t1 &lt;= t2</code> is always <code>true</code> and the time between clock ticks is constant, otherwise <code>false</code> . |
| <code>C1::now()</code>      | <code>C1::time_point</code>                                                                          | Returns a <code>time_point</code> object representing the current point in time.                                                                       |

NOTE 2 The relative difference in durations between those reported by a given clock and the SI definition is a measure of the quality of implementation.

A type TC meets the Cpp17TrivialClock requirements if

- TC meets the Cpp17Clock requirements,
- the types `TC::rep`, `TC::duration`, and `TC::time_point` meet the Cpp17EqualityComparable (Table 28) and Cpp17LessThanComparable (Table 29) and Cpp17Swappable (16.4.4.3) requirements and the requirements of numeric types (28.2),

NOTE 3 This means, in particular, that operations on these types will not throw exceptions.

- the function `TC::now()` does not throw exceptions, and
- the type `TC::time_point::clock` meets the Cpp17TrivialClock requirements, recursively.

## 29.4 Time-related traits

[time.traits]

### 29.4.1 treat\_as\_floating\_point

[time.traits.is.fp]

```
template<class Rep> struct treat_as_floating_point : is_floating_point<Rep> { };
```

The `duration` template uses the `treat_as_floating_point` trait to help determine if a `duration` object can be converted to another `duration` with a different tick period. If `treat_as_floating_point_v<Rep>` is `true`, then implicit conversions are allowed among durations. Otherwise, the implicit convertibility depends on the tick periods of the durations.

NOTE The intention of this trait is to indicate whether a given class behaves like a floating-point type, and thus allows division of one value by another with acceptable loss of precision. If `treat_as_floating_point_v<Rep>` is `false`, `Rep` will be treated as if it behaved like an integral type for the purpose of these conversions.

### 29.4.2 duration\_values

[time.traits.duration.values]

```
template<class Rep>
struct duration_values {
public:
    static constexpr Rep zero() noexcept;
    static constexpr Rep min() noexcept;
    static constexpr Rep max() noexcept;
};
```

The `duration` template uses the `duration_values` trait to construct special values of the duration's representation (`Rep`). This is done because the representation can be a class type with behavior that requires some other implementation to return these special values. In that case, the author of that class type should specialize `duration_values` to return the indicated values.

```
static constexpr Rep zero() noexcept;
```

*Returns:* `Rep(0)`.

NOTE `Rep(0)` is specified instead of `Rep()` because `Rep()` can have some other meaning, such as an uninitialized value.

*Remarks:* The value returned shall be the additive identity.

```
static constexpr Rep min() noexcept;
```

*Returns:* `numeric_limits<Rep>::lowest()`.

*Remarks:* The value returned shall compare less than or equal to `zero()`.

```
static constexpr Rep max() noexcept;
```

*Returns:* `numeric_limits<Rep>::max()`.

*Remarks:* The value returned shall compare greater than `zero()`.

### 29.4.3 Specializations of common\_type

[time.traits.specializations]

```
template<class Rep1, class Period1, class Rep2, class Period2>
struct common_type<chrono::duration<Rep1, Period1>, chrono::duration<Rep2, Period2>> {
    using type = chrono::duration<common_type_t<Rep1, Rep2>, see below>;
};
```

The period of the `duration` indicated by this specialization of `common_type` is the greatest common divisor of `Period1` and `Period2`.

NOTE 1 This can be computed by forming a ratio of the greatest common divisor of `Period1::num` and `Period2::num` and the least common multiple of `Period1::den` and `Period2::den`.

NOTE 2 The `typedef` name `type` is a synonym for the `duration` with the largest tick period possible where both `duration` arguments will convert to it without requiring a division operation. The representation of this type is intended to be able to hold any value resulting from this conversion with no truncation error, although floating-point durations can have round-off errors.

```
template<class Clock, class Duration1, class Duration2>
struct common_type<chrono::time_point<Clock, Duration1>, chrono::time_point<Clock, Duration2>> {
    using type = chrono::time_point<Clock, common_type_t<Duration1, Duration2>>;
};
```

```
};
```

The common type of two `time_point` types is a `time_point` with the same clock as the two types and the common type of their two durations.

#### 29.4.4 Class template `is_clock`

[time.traits.is.clock]

```
template<class T> struct is_clock;
```

`is_clock` is a *Cpp17UnaryTypeTrait* (21.3.2) with a base characteristic of `true_type` if `T` meets the *Cpp17Clock* requirements (29.3), otherwise `false_type`. For the purposes of the specification of this trait, the extent to which an implementation determines that a type cannot meet the *Cpp17Clock* requirements is unspecified, except that as a minimum a type `T` shall not qualify as a *Cpp17Clock* unless it meets all of the following conditions:

- the *qualified-ids* `T::rep`, `T::period`, `T::duration`, and `T::time_point` are valid and each denotes a type (13.10.3),
- the expression `T::is_steady` is well-formed when treated as an unevaluated operand (7.2.3),
- the expression `T::now()` is well-formed when treated as an unevaluated operand.

The behavior of a program that adds specializations for `is_clock` is undefined.

### 29.5 Class template `duration`

[time.duration]

#### 29.5.1 General

[time.duration.general]

A `duration` type measures time between two points in time (`time_points`). A `duration` has a representation which holds a count of ticks and a tick period. The tick period is the amount of time which occurs from one tick to the next, in units of seconds. It is expressed as a rational constant using the template `ratio`.

```
namespace std::chrono {
    template<class Rep, class Period = ratio<1>>
    class duration {
    public:
        using rep      = Rep;
        using period    = typename Period::type;

    private:
        rep rep_;       // exposition only

    public:
        // 29.5.2, construct/copy/destroy
        constexpr duration() = default;
        template<class Rep2>
            constexpr explicit duration(const Rep2& r);
        template<class Rep2, class Period2>
            constexpr duration(const duration<Rep2, Period2>& d);
        ~duration() = default;
        duration(const duration&) = default;
        duration& operator=(const duration&) = default;

        // 29.5.3, observer
        constexpr rep count() const;

        // 29.5.4, arithmetic
        constexpr common_type_t<duration> operator+() const;
        constexpr common_type_t<duration> operator-() const;
        constexpr duration& operator++();
        constexpr duration operator++(int);
        constexpr duration& operator--();
        constexpr duration operator--(int);

        constexpr duration& operator+=(const duration& d);
        constexpr duration& operator-=(const duration& d);
```

```

constexpr duration& operator*=(const rep& rhs);
constexpr duration& operator/=(const rep& rhs);
constexpr duration& operator%=(const rep& rhs);
constexpr duration& operator%=(const duration& rhs);

// 29.5.5, special values
static constexpr duration zero() noexcept;
static constexpr duration min() noexcept;
static constexpr duration max() noexcept;
};
}

```

Rep shall be an arithmetic type or a class emulating an arithmetic type. If `duration` is instantiated with a `duration` type as the argument for the template parameter `Rep`, the program is ill-formed.

If `Period` is not a specialization of `ratio`, the program is ill-formed. If `Period::num` is not positive, the program is ill-formed.

Members of `duration` do not throw exceptions other than those thrown by the indicated operations on their representations.

The defaulted copy constructor of `duration` shall be a `constexpr` function if and only if the required initialization of the member `rep_` for copy and move, respectively, would be `constexpr-suitable` (9.2.6).

EXAMPLE

```

duration<long, ratio<60>> d0;           // holds a count of minutes using a long
duration<long long, milli> d1;         // holds a count of milliseconds using a long long
duration<double, ratio<1, 30>> d2;     // holds a count with a tick period of  $\frac{1}{30}$  of a second
                                         // (30 Hz) using a double

```

## 29.5.2 Constructors

[time.duration.cons]

```
template<class Rep2>
```

```
constexpr explicit duration(const Rep2& r);
```

*Constraints:* `is_convertible_v<const Rep2&, rep>` is true and

— `treat_as_floating_point_v<rep>` is true or

— `treat_as_floating_point_v<Rep2>` is false.

EXAMPLE 1

```

duration<int, milli> d(3);             // OK
duration<int, milli> d(3.5);           // error

```

*Effects:* Initializes `rep_` with `r`.

```
template<class Rep2, class Period2>
```

```
constexpr duration(const duration<Rep2, Period2>& d);
```

*Constraints:* No overflow is induced in the conversion and `treat_as_floating_point_v<rep>` is true or both `ratio_divide<Period2, period>::den` is 1 and `treat_as_floating_point_v<Rep2>` is false.

NOTE This requirement prevents implicit truncation error when converting between integral-based `duration` types. Such a construction can lead to confusion about the value of the `duration`.

EXAMPLE 2

```

duration<int, milli> ms(3);
duration<int, micro> us = ms;         // OK
duration<int, milli> ms2 = us;        // error

```

*Effects:* Initializes `rep_` with `duration_cast<duration>(d).count()`.

## 29.5.3 Observer

[time.duration.observer]

```
constexpr rep count() const;
```

*Returns:* `rep_`.

**29.5.4 Arithmetic****[time.duration.arithmetic]**

```
constexpr common_type_t<duration> operator+() const;
```

*Returns:* common\_type\_t<duration>(\*this).

```
constexpr common_type_t<duration> operator-() const;
```

*Returns:* common\_type\_t<duration>(-rep\_).

```
constexpr duration& operator++();
```

*Effects:* Equivalent to: ++rep\_.

*Returns:* \*this.

```
constexpr duration operator++(int);
```

*Effects:* Equivalent to: return duration(rep\_++);

```
constexpr duration& operator--();
```

*Effects:* Equivalent to: --rep\_.

*Returns:* \*this.

```
constexpr duration operator--(int);
```

*Effects:* Equivalent to: return duration(rep\_--);

```
constexpr duration& operator+=(const duration& d);
```

*Effects:* Equivalent to: rep\_ += d.count().

*Returns:* \*this.

```
constexpr duration& operator-=(const duration& d);
```

*Effects:* Equivalent to: rep\_ -= d.count().

*Returns:* \*this.

```
constexpr duration& operator*=(const rep& rhs);
```

*Effects:* Equivalent to: rep\_ \*= rhs.

*Returns:* \*this.

```
constexpr duration& operator/=(const rep& rhs);
```

*Effects:* Equivalent to: rep\_ /= rhs.

*Returns:* \*this.

```
constexpr duration& operator%=(const rep& rhs);
```

*Effects:* Equivalent to: rep\_ %= rhs.

*Returns:* \*this.

```
constexpr duration& operator%=(const duration& rhs);
```

*Effects:* Equivalent to: rep\_ %= rhs.count().

*Returns:* \*this.

**29.5.5 Special values****[time.duration.special]**

```
static constexpr duration zero() noexcept;
```

*Returns:* duration(duration\_values<rep>::zero()).

```
static constexpr duration min() noexcept;
```

*Returns:* duration(duration\_values<rep>::min()).

```
static constexpr duration max() noexcept;
```

*Returns:* duration(duration\_values<rep>::max()).

**29.5.6 Non-member arithmetic****[time.duration.nonmember]**

In the function descriptions that follow, unless stated otherwise, let CD represent the return type of the function.

```
template<class Rep1, class Period1, class Rep2, class Period2>
constexpr common_type_t<duration<Rep1, Period1>, duration<Rep2, Period2>>
operator+(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);

Returns: CD(CD(lhs).count() + CD(rhs).count()).
```

```
template<class Rep1, class Period1, class Rep2, class Period2>
constexpr common_type_t<duration<Rep1, Period1>, duration<Rep2, Period2>>
operator-(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);

Returns: CD(CD(lhs).count() - CD(rhs).count()).
```

```
template<class Rep1, class Period, class Rep2>
constexpr duration<common_type_t<Rep1, Rep2>, Period>
operator*(const duration<Rep1, Period>& d, const Rep2& s);

Constraints: is_convertible_v<const Rep2&, common_type_t<Rep1, Rep2>> is true.

Returns: CD(CD(d).count() * s).
```

```
template<class Rep1, class Rep2, class Period>
constexpr duration<common_type_t<Rep1, Rep2>, Period>
operator*(const Rep1& s, const duration<Rep2, Period>& d);

Constraints: is_convertible_v<const Rep1&, common_type_t<Rep1, Rep2>> is true.

Returns: d * s.
```

```
template<class Rep1, class Period, class Rep2>
constexpr duration<common_type_t<Rep1, Rep2>, Period>
operator/(const duration<Rep1, Period>& d, const Rep2& s);

Constraints: is_convertible_v<const Rep2&, common_type_t<Rep1, Rep2>> is true and Rep2 is
not a specialization of duration.

Returns: CD(CD(d).count() / s).
```

```
template<class Rep1, class Period1, class Rep2, class Period2>
constexpr common_type_t<Rep1, Rep2>
operator/(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);

Let CD be common_type_t<duration<Rep1, Period1>, duration<Rep2, Period2>>.

Returns: CD(lhs).count() / CD(rhs).count().
```

```
template<class Rep1, class Period, class Rep2>
constexpr duration<common_type_t<Rep1, Rep2>, Period>
operator%(const duration<Rep1, Period>& d, const Rep2& s);

Constraints: is_convertible_v<const Rep2&, common_type_t<Rep1, Rep2>> is true and Rep2 is
not a specialization of duration.

Returns: CD(CD(d).count() % s).
```

```
template<class Rep1, class Period1, class Rep2, class Period2>
constexpr common_type_t<duration<Rep1, Period1>, duration<Rep2, Period2>>
operator%(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);

Returns: CD(CD(lhs).count() % CD(rhs).count()).
```

**29.5.7 Comparisons****[time.duration.comparisons]**

In the function descriptions that follow, CT represents common\_type\_t<A, B>, where A and B are the types of the two arguments to the function.

```
template<class Rep1, class Period1, class Rep2, class Period2>
constexpr bool operator==(const duration<Rep1, Period1>& lhs,
                          const duration<Rep2, Period2>& rhs);
```

*Returns:* CT(lhs).count() == CT(rhs).count().

```
template<class Rep1, class Period1, class Rep2, class Period2>
constexpr bool operator<(const duration<Rep1, Period1>& lhs,
                        const duration<Rep2, Period2>& rhs);
```

*Returns:* CT(lhs).count() < CT(rhs).count().

```
template<class Rep1, class Period1, class Rep2, class Period2>
constexpr bool operator>(const duration<Rep1, Period1>& lhs,
                        const duration<Rep2, Period2>& rhs);
```

*Returns:* rhs < lhs.

```
template<class Rep1, class Period1, class Rep2, class Period2>
constexpr bool operator<=(const duration<Rep1, Period1>& lhs,
                         const duration<Rep2, Period2>& rhs);
```

*Returns:* !(rhs < lhs).

```
template<class Rep1, class Period1, class Rep2, class Period2>
constexpr bool operator>=(const duration<Rep1, Period1>& lhs,
                         const duration<Rep2, Period2>& rhs);
```

*Returns:* !(lhs < rhs).

```
template<class Rep1, class Period1, class Rep2, class Period2>
requires three_way_comparable<typename CT::rep>
constexpr auto operator<=>(const duration<Rep1, Period1>& lhs,
                          const duration<Rep2, Period2>& rhs);
```

*Returns:* CT(lhs).count() <=> CT(rhs).count().

## 29.5.8 Conversions

[time.duration.cast]

```
template<class ToDuration, class Rep, class Period>
constexpr ToDuration duration_cast(const duration<Rep, Period>& d);
```

*Constraints:* ToDuration is a specialization of duration.

*Returns:* Let CF be ratio\_divide<Period, typename ToDuration::period>, and CR be common\_type<typename ToDuration::rep, Rep, intmax\_t>::type.

— If CF::num == 1 and CF::den == 1, returns

ToDuration(static\_cast<typename ToDuration::rep>(d.count()))

— otherwise, if CF::num != 1 and CF::den == 1, returns

ToDuration(static\_cast<typename ToDuration::rep>(
 static\_cast<CR>(d.count()) \* static\_cast<CR>(CF::num)))

— otherwise, if CF::num == 1 and CF::den != 1, returns

ToDuration(static\_cast<typename ToDuration::rep>(
 static\_cast<CR>(d.count()) / static\_cast<CR>(CF::den)))

— otherwise, returns

ToDuration(static\_cast<typename ToDuration::rep>(
 static\_cast<CR>(d.count()) \* static\_cast<CR>(CF::num) / static\_cast<CR>(CF::den)))

NOTE This function does not use any implicit conversions; all conversions are done with `static_cast`. It avoids multiplications and divisions when it is known at compile time that one or more arguments is 1. Intermediate computations are carried out in the widest representation and only converted to the destination representation at the final step.

```
template<class ToDuration, class Rep, class Period>
constexpr ToDuration floor(const duration<Rep, Period>& d);
```

*Constraints:* ToDuration is a specialization of duration.

*Returns:* The greatest result *t* representable in *ToDuration* for which *t* ≤ *d*.

```
template<class ToDuration, class Rep, class Period>
constexpr ToDuration ceil(const duration<Rep, Period>& d);
```

*Constraints:* *ToDuration* is a specialization of *duration*.

*Returns:* The least result *t* representable in *ToDuration* for which *t* ≥ *d*.

```
template<class ToDuration, class Rep, class Period>
constexpr ToDuration round(const duration<Rep, Period>& d);
```

*Constraints:* *ToDuration* is a specialization of *duration* and *treat\_as\_floating\_point\_v*<typename *ToDuration::rep*> is false.

*Returns:* The value of *ToDuration* that is closest to *d*. If there are two closest values, then return the value *t* for which *t* % 2 == 0.

### 29.5.9 Suffixes for duration literals

[time.duration.literals]

This subclause describes literal suffixes for constructing duration literals. The suffixes *h*, *min*, *s*, *ms*, *us*, *ns* denote duration values of the corresponding types *hours*, *minutes*, *seconds*, *milliseconds*, *microseconds*, and *nanoseconds* respectively if they are applied to *integer-literals*.

If any of these suffixes are applied to a *floating-point-literal* the result is a *chrono::duration* literal with an unspecified floating-point representation.

If any of these suffixes are applied to an *integer-literal* and the resulting *chrono::duration* value cannot be represented in the result type because of overflow, the program is ill-formed.

EXAMPLE The following code shows some duration literals.

```
using namespace std::chrono_literals;
auto constexpr aday=24h;
auto constexpr lesson=45min;
auto constexpr halfanhour=0.5h;

constexpr chrono::hours operator""h(unsigned long long hours);
constexpr chrono::duration<unspecified, ratio<3600, 1>> operator""h(long double hours);
```

*Returns:* A duration literal representing *hours* hours.

```
constexpr chrono::minutes operator""min(unsigned long long minutes);
constexpr chrono::duration<unspecified, ratio<60, 1>> operator""min(long double minutes);
```

*Returns:* A duration literal representing *minutes* minutes.

```
constexpr chrono::seconds operator""s(unsigned long long sec);
constexpr chrono::duration<unspecified> operator""s(long double sec);
```

*Returns:* A duration literal representing *sec* seconds.

NOTE The same suffix *s* is used for *basic\_string* but there is no conflict, since duration suffixes apply to numbers and string literal suffixes apply to character array literals.

```
constexpr chrono::milliseconds operator""ms(unsigned long long msec);
constexpr chrono::duration<unspecified, milli> operator""ms(long double msec);
```

*Returns:* A duration literal representing *msec* milliseconds.

```
constexpr chrono::microseconds operator""us(unsigned long long usec);
constexpr chrono::duration<unspecified, micro> operator""us(long double usec);
```

*Returns:* A duration literal representing *usec* microseconds.

```
constexpr chrono::nanoseconds operator""ns(unsigned long long nsec);
constexpr chrono::duration<unspecified, nano> operator""ns(long double nsec);
```

*Returns:* A duration literal representing *nsec* nanoseconds.

## 29.5.10 Algorithms

[time.duration.alg]

```
template<class Rep, class Period>
constexpr duration<Rep, Period> abs(duration<Rep, Period> d);
```

*Constraints:* numeric\_limits<Rep>::is\_signed is true.

*Returns:* If  $d \geq d.zero()$ , return  $d$ , otherwise return  $-d$ .

## 29.5.11 I/O

[time.duration.io]

```
template<class charT, class traits, class Rep, class Period>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const duration<Rep, Period>& d);
```

*Effects:* Inserts the duration  $d$  onto the stream  $os$  as if it were implemented as follows:

```
basic_ostringstream<charT, traits> s;
s.flags(os.flags());
s.imbue(os.getloc());
s.precision(os.precision());
s << d.count() << units-suffix;
return os << s.str();
```

where *units-suffix* depends on the type `Period::type` as follows:

- If `Period::type` is `atto`, *units-suffix* is "as".
- Otherwise, if `Period::type` is `femto`, *units-suffix* is "fs".
- Otherwise, if `Period::type` is `pico`, *units-suffix* is "ps".
- Otherwise, if `Period::type` is `nano`, *units-suffix* is "ns".
- Otherwise, if `Period::type` is `micro`, it is implementation-defined whether *units-suffix* is "µs" ("u00b5\u0073") or "us".
- Otherwise, if `Period::type` is `milli`, *units-suffix* is "ms".
- Otherwise, if `Period::type` is `centi`, *units-suffix* is "cs".
- Otherwise, if `Period::type` is `deci`, *units-suffix* is "ds".
- Otherwise, if `Period::type` is `ratio<1>`, *units-suffix* is "s".
- Otherwise, if `Period::type` is `deca`, *units-suffix* is "das".
- Otherwise, if `Period::type` is `hecto`, *units-suffix* is "hs".
- Otherwise, if `Period::type` is `kilo`, *units-suffix* is "ks".
- Otherwise, if `Period::type` is `mega`, *units-suffix* is "Ms".
- Otherwise, if `Period::type` is `giga`, *units-suffix* is "Gs".
- Otherwise, if `Period::type` is `tera`, *units-suffix* is "Ts".
- Otherwise, if `Period::type` is `peta`, *units-suffix* is "Ps".
- Otherwise, if `Period::type` is `exa`, *units-suffix* is "Es".
- Otherwise, if `Period::type` is `ratio<60>`, *units-suffix* is "min".
- Otherwise, if `Period::type` is `ratio<3600>`, *units-suffix* is "h".
- Otherwise, if `Period::type` is `ratio<86400>`, *units-suffix* is "d".
- Otherwise, if `Period::type::den == 1`, *units-suffix* is "[num]s".
- Otherwise, *units-suffix* is "[num/den]s".

In the list above, the use of *num* and *den* refers to the static data members of `Period::type`, which are converted to arrays of `charT` using a decimal conversion with no leading zeroes.

*Returns:*  $os$ .

```
template<class charT, class traits, class Rep, class Period, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
            duration<Rep, Period>& d,
```

```
basic_string<charT, traits, Alloc>* abbrev = nullptr,
minutes* offset = nullptr);
```

*Effects:* Attempts to parse the input stream *is* into the duration *d* using the format flags given in the NTCTS *fmt* as specified in 29.13. If the parse fails to decode a valid duration, *is.setstate(ios\_base::failbit)* is called and *d* is not modified. If *%Z* is used and successfully parsed, that value will be assigned to *\*abbrev* if *abbrev* is non-null. If *%z* (or a modified variant) is used and successfully parsed, that value will be assigned to *\*offset* if *offset* is non-null.

*Returns:* *is*.

## 29.6 Class template `time_point`

[time.point]

### 29.6.1 General

[time.point.general]

```
namespace std::chrono {
    template<class Clock, class Duration = typename Clock::duration>
    class time_point {
    public:
        using clock      = Clock;
        using duration    = Duration;
        using rep         = typename duration::rep;
        using period      = typename duration::period;

    private:
        duration d_; // exposition only

    public:
        // 29.6.2, construct
        constexpr time_point(); // has value epoch
        constexpr explicit time_point(const duration& d); // same as time_point() + d
        template<class Duration2>
            constexpr time_point(const time_point<clock, Duration2>& t);

        // 29.6.3, observer
        constexpr duration time_since_epoch() const;

        // 29.6.4, arithmetic
        constexpr time_point& operator++();
        constexpr time_point operator++(int);
        constexpr time_point& operator--();
        constexpr time_point operator--(int);
        constexpr time_point& operator+=(const duration& d);
        constexpr time_point& operator-=(const duration& d);

        // 29.6.5, special values
        static constexpr time_point min() noexcept;
        static constexpr time_point max() noexcept;
    };
}
```

If *Duration* is not a specialization of *duration*, the program is ill-formed.

### 29.6.2 Constructors

[time.point.cons]

```
constexpr time_point();
```

*Effects:* Initializes *d\_* with *duration::zero()*. Such a *time\_point* object represents the epoch.

```
constexpr explicit time_point(const duration& d);
```

*Effects:* Initializes *d\_* with *d*. Such a *time\_point* object represents the epoch + *d*.

```
template<class Duration2>
constexpr time_point(const time_point<clock, Duration2>& t);
```

*Constraints:* *is\_convertible\_v<Duration2, duration>* is true.

*Effects:* Initializes *d\_* with *t.time\_since\_epoch()*.

**29.6.3 Observer****[time.point.observer]**

```
constexpr duration time_since_epoch() const;
```

*Returns:* d\_.

**29.6.4 Arithmetic****[time.point.arithmetic]**

```
constexpr time_point& operator++();
```

*Effects:* Equivalent to: ++d\_.

*Returns:* \*this.

```
constexpr time_point operator++(int);
```

*Effects:* Equivalent to: return time\_point{d\_++};

```
constexpr time_point& operator--();
```

*Effects:* Equivalent to: --d\_.

*Returns:* \*this.

```
constexpr time_point operator--(int);
```

*Effects:* Equivalent to: return time\_point{d\_--};

```
constexpr time_point& operator+=(const duration& d);
```

*Effects:* Equivalent to: d\_ += d.

*Returns:* \*this.

```
constexpr time_point& operator-=(const duration& d);
```

*Effects:* Equivalent to: d\_ -= d.

*Returns:* \*this.

**29.6.5 Special values****[time.point.special]**

```
static constexpr time_point min() noexcept;
```

*Returns:* time\_point(duration::min()).

```
static constexpr time_point max() noexcept;
```

*Returns:* time\_point(duration::max()).

**29.6.6 Non-member arithmetic****[time.point.nonmember]**

```
template<class Clock, class Duration1, class Rep2, class Period2>
```

```
constexpr time_point<Clock, common_type_t<Duration1, duration<Rep2, Period2>>>
```

```
operator+(const time_point<Clock, Duration1>& lhs, const duration<Rep2, Period2>& rhs);
```

*Returns:* CT(lhs.time\_since\_epoch() + rhs), where CT is the type of the return value.

```
template<class Rep1, class Period1, class Clock, class Duration2>
```

```
constexpr time_point<Clock, common_type_t<duration<Rep1, Period1>, Duration2>>
```

```
operator+(const duration<Rep1, Period1>& lhs, const time_point<Clock, Duration2>& rhs);
```

*Returns:* rhs + lhs.

```
template<class Clock, class Duration1, class Rep2, class Period2>
```

```
constexpr time_point<Clock, common_type_t<Duration1, duration<Rep2, Period2>>>
```

```
operator-(const time_point<Clock, Duration1>& lhs, const duration<Rep2, Period2>& rhs);
```

*Returns:* CT(lhs.time\_since\_epoch() - rhs), where CT is the type of the return value.

```
template<class Clock, class Duration1, class Duration2>
```

```
constexpr common_type_t<Duration1, Duration2>
```

```
operator-(const time_point<Clock, Duration1>& lhs, const time_point<Clock, Duration2>& rhs);
```

*Returns:* lhs.time\_since\_epoch() - rhs.time\_since\_epoch().

## 29.6.7 Comparisons

[time.point.comparisons]

```
template<class Clock, class Duration1, class Duration2>
constexpr bool operator==(const time_point<Clock, Duration1>& lhs,
                          const time_point<Clock, Duration2>& rhs);
```

*Returns:* lhs.time\_since\_epoch() == rhs.time\_since\_epoch().

```
template<class Clock, class Duration1, class Duration2>
constexpr bool operator<(const time_point<Clock, Duration1>& lhs,
                        const time_point<Clock, Duration2>& rhs);
```

*Returns:* lhs.time\_since\_epoch() < rhs.time\_since\_epoch().

```
template<class Clock, class Duration1, class Duration2>
constexpr bool operator>(const time_point<Clock, Duration1>& lhs,
                        const time_point<Clock, Duration2>& rhs);
```

*Returns:* rhs < lhs.

```
template<class Clock, class Duration1, class Duration2>
constexpr bool operator<=(const time_point<Clock, Duration1>& lhs,
                         const time_point<Clock, Duration2>& rhs);
```

*Returns:* !(rhs < lhs).

```
template<class Clock, class Duration1, class Duration2>
constexpr bool operator>=(const time_point<Clock, Duration1>& lhs,
                         const time_point<Clock, Duration2>& rhs);
```

*Returns:* !(lhs < rhs).

```
template<class Clock, class Duration1,
        three_way_comparable_with<Duration1> Duration2>
constexpr auto operator<=>(const time_point<Clock, Duration1>& lhs,
                          const time_point<Clock, Duration2>& rhs);
```

*Returns:* lhs.time\_since\_epoch() <=> rhs.time\_since\_epoch().

## 29.6.8 Conversions

[time.point.cast]

```
template<class ToDuration, class Clock, class Duration>
constexpr time_point<Clock, ToDuration> time_point_cast(const time_point<Clock, Duration>& t);
```

*Constraints:* ToDuration is a specialization of duration.

*Returns:*

time\_point<Clock, ToDuration>(duration\_cast<ToDuration>(t.time\_since\_epoch()))

```
template<class ToDuration, class Clock, class Duration>
constexpr time_point<Clock, ToDuration> floor(const time_point<Clock, Duration>& tp);
```

*Constraints:* ToDuration is a specialization of duration.

*Returns:* time\_point<Clock, ToDuration>(floor<ToDuration>(tp.time\_since\_epoch())).

```
template<class ToDuration, class Clock, class Duration>
constexpr time_point<Clock, ToDuration> ceil(const time_point<Clock, Duration>& tp);
```

*Constraints:* ToDuration is a specialization of duration.

*Returns:* time\_point<Clock, ToDuration>(ceil<ToDuration>(tp.time\_since\_epoch())).

```
template<class ToDuration, class Clock, class Duration>
constexpr time_point<Clock, ToDuration> round(const time_point<Clock, Duration>& tp);
```

*Constraints:* ToDuration is a specialization of duration, and treat\_as\_floating\_point\_v<typename ToDuration::rep> is false.

*Returns:* time\_point<Clock, ToDuration>(round<ToDuration>(tp.time\_since\_epoch())).

## 29.7 Clocks

[time.clock]

### 29.7.1 General

[time.clock.general]

The types defined in 29.7 meet the *Cpp17TrivialClock* requirements (29.3) unless otherwise specified.

### 29.7.2 Class `system_clock`

[time.clock.system]

#### 29.7.2.1 Overview

[time.clock.system.overview]

```
namespace std::chrono {
    class system_clock {
    public:
        using rep          = see below;
        using period        = ratio<unspecified, unspecified>;
        using duration      = chrono::duration<rep, period>;
        using time_point    = chrono::time_point<system_clock>;
        static constexpr bool is_steady = unspecified;

        static time_point now() noexcept;

        // mapping to/from C type time_t
        static time_t      to_time_t (const time_point& t) noexcept;
        static time_point  from_time_t(time_t t) noexcept;
    };
}
```

Objects of type `system_clock` represent wall clock time from the system-wide realtime clock. Objects of type `sys_time<Duration>` measure time since 1970-01-01 00:00:00 UTC excluding leap seconds. This measure is commonly referred to as *Unix time*. This measure facilitates an efficient mapping between `sys_time` and calendar types (29.8).

#### EXAMPLE

`sys_seconds{sys_days{1970y/January/1}}.time_since_epoch()` is 0s.  
`sys_seconds{sys_days{2000y/January/1}}.time_since_epoch()` is 946'684'800s, which is 10'957 \* 86'400s.

#### 29.7.2.2 Members

[time.clock.system.members]

```
using system_clock::rep = unspecified;
```

*Constraints:* `system_clock::duration::min() < system_clock::duration::zero()` is true.

NOTE This implies that `rep` is a signed type.

```
static time_t to_time_t(const time_point& t) noexcept;
```

*Returns:* A `time_t` object that represents the same point in time as `t` when both values are restricted to the coarser of the precisions of `time_t` and `time_point`. It is implementation-defined whether values are rounded or truncated to the required precision.

```
static time_point from_time_t(time_t t) noexcept;
```

*Returns:* A `time_point` object that represents the same point in time as `t` when both values are restricted to the coarser of the precisions of `time_t` and `time_point`. It is implementation-defined whether values are rounded or truncated to the required precision.

#### 29.7.2.3 Non-member functions

[time.clock.system.nonmembers]

```
template<class charT, class traits, class Duration>
```

```
    basic_ostream<charT, traits>&
```

```
    operator<<(basic_ostream<charT, traits>& os, const sys_time<Duration>& tp);
```

*Constraints:* `treat_as_floating_point_v<typename Duration::rep>` is false, and `Duration{1} < days{1}` is true.

*Effects:* Equivalent to:

```
    return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L%F %T}"), tp);
```

## EXAMPLE

```
cout << sys_seconds{0s} << '\n';           // 1970-01-01 00:00:00
cout << sys_seconds{946'684'800s} << '\n';    // 2000-01-01 00:00:00
cout << sys_seconds{946'688'523s} << '\n';    // 2000-01-01 01:02:03
```

```
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const sys_days& dp);
```

*Effects:* os << year\_month\_day{dp}.

*Returns:* os.

```
template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
            sys_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,
            minutes* offset = nullptr);
```

*Effects:* Attempts to parse the input stream is into the `sys_time` `tp` using the format flags given in the NTCTS `fmt` as specified in 29.13. If the parse fails to decode a valid date, `is.setstate(ios_base::failbit)` is called and `tp` is not modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null. Additionally, the parsed offset will be subtracted from the successfully parsed timestamp prior to assigning that difference to `tp`.

*Returns:* is.

### 29.7.3 Class `utc_clock`

[time.clock.utc]

#### 29.7.3.1 Overview

[time.clock.utc.overview]

```
namespace std::chrono {
class utc_clock {
public:
    using rep                = a signed arithmetic type;
    using period              = ratio<unspecified, unspecified>;
    using duration            = chrono::duration<rep, period>;
    using time_point          = chrono::time_point<utc_clock>;
    static constexpr bool is_steady = unspecified;

    static time_point now();

    template<class Duration>
    static sys_time<common_type_t<Duration, seconds>>
        to_sys(const utc_time<Duration>& t);
    template<class Duration>
    static utc_time<common_type_t<Duration, seconds>>
        from_sys(const sys_time<Duration>& t);
};
}
```

In contrast to `sys_time`, which does not take leap seconds into account, `utc_clock` and its associated `time_point`, `utc_time`, count time, including leap seconds, since 1970-01-01 00:00:00 UTC.

NOTE 1 The UTC time standard began on 1972-01-01 00:00:10 TAI. To measure time since this epoch instead, one can add/subtract the constant `sys_days{1972y/1/1} - sys_days{1970y/1/1}` (63'072'000s) from the `utc_time`.

## EXAMPLE

```
clock_cast<utc_clock>(sys_seconds{sys_days{1970y/January/1}}).time_since_epoch() is 0s.
clock_cast<utc_clock>(sys_seconds{sys_days{2000y/January/1}}).time_since_epoch() is 946'684'822s,
which is 10'957 * 86'400s + 22s.
```

`utc_clock` is not a *Cpp17TrivialClock* unless the implementation can guarantee that `utc_clock::now()` does not propagate an exception.

NOTE 2 `noexcept(from_sys(system_clock::now()))` is false.

## 29.7.3.2 Member functions

[time.clock.utc.members]

```
static time_point now();
```

*Returns:* from\_sys(system\_clock::now()), or a more accurate value of utc\_time.

```
template<class Duration>
static sys_time<common_type_t<Duration, seconds>>
to_sys(const utc_time<Duration>& u);
```

*Returns:* A sys\_time t, such that from\_sys(t) == u if such a mapping exists. Otherwise u represents a time\_point during a positive leap second insertion, the conversion counts that leap second as not inserted, and the last representable value of sys\_time prior to the insertion of the leap second is returned.

```
template<class Duration>
static utc_time<common_type_t<Duration, seconds>>
from_sys(const sys_time<Duration>& t);
```

*Returns:* A utc\_time u, such that u.time\_since\_epoch() - t.time\_since\_epoch() is equal to the sum of leap seconds that were inserted between t and 1970-01-01. If t is exactly the date of leap second insertion, then the conversion counts that leap second as inserted.

EXAMPLE

```
auto t = sys_days{July/1/2015} - 2ns;
auto u = utc_clock::from_sys(t);
assert(u.time_since_epoch() - t.time_since_epoch() == 25s);
t += 1ns;
u = utc_clock::from_sys(t);
assert(u.time_since_epoch() - t.time_since_epoch() == 25s);
t += 1ns;
u = utc_clock::from_sys(t);
assert(u.time_since_epoch() - t.time_since_epoch() == 26s);
t += 1ns;
u = utc_clock::from_sys(t);
assert(u.time_since_epoch() - t.time_since_epoch() == 26s);
```

## 29.7.3.3 Non-member functions

[time.clock.utc.nonmembers]

```
template<class charT, class traits, class Duration>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const utc_time<Duration>& t);
```

*Effects:* Equivalent to:

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L%F %T}"), t);
```

EXAMPLE

```
auto t = sys_days{July/1/2015} - 500ms;
auto u = clock_cast<utc_clock>(t);
for (auto i = 0; i < 8; ++i, u += 250ms)
    cout << u << " UTC\n";
```

Produces this output:

```
2015-06-30 23:59:59.500 UTC
2015-06-30 23:59:59.750 UTC
2015-06-30 23:59:60.000 UTC
2015-06-30 23:59:60.250 UTC
2015-06-30 23:59:60.500 UTC
2015-06-30 23:59:60.750 UTC
2015-07-01 00:00:00.000 UTC
2015-07-01 00:00:00.250 UTC
```

```
template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
            utc_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,
```

```
minutes* offset = nullptr);
```

*Effects:* Attempts to parse the input stream `is` into the `utc_time` `tp` using the format flags given in the NTCTS `fmt` as specified in 29.13. If the parse fails to decode a valid date, `is.setstate(ios_base::failbit)` is called and `tp` is not modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null. Additionally, the parsed offset will be subtracted from the successfully parsed timestamp prior to assigning that difference to `tp`.

*Returns:* `is`.

```
struct leap_second_info {
    bool    is_leap_second;
    seconds elapsed;
};
```

The type `leap_second_info` has data members and special members specified above. It has no base classes or members other than those specified.

```
template<class Duration>
leap_second_info get_leap_second_info(const utc_time<Duration>& ut);
```

*Returns:* A `leap_second_info` `lsi`, where `lsi.is_leap_second` is `true` if `ut` is during a positive leap second insertion, and otherwise `false`. `lsi.elapsed` is the sum of leap seconds between 1970-01-01 and `ut`. If `lsi.is_leap_second` is `true`, the leap second referred to by `ut` is included in the sum.

## 29.7.4 Class `tai_clock`

[time.clock.tai]

### 29.7.4.1 Overview

[time.clock.tai.overview]

```
namespace std::chrono {
    class tai_clock {
    public:
        using rep                = a signed arithmetic type;
        using period              = ratio<unspecified, unspecified>;
        using duration            = chrono::duration<rep, period>;
        using time_point          = chrono::time_point<tai_clock>;
        static constexpr bool is_steady = unspecified;

        static time_point now();

        template<class Duration>
            static utc_time<common_type_t<Duration, seconds>>
                to_utc(const tai_time<Duration>&) noexcept;
        template<class Duration>
            static tai_time<common_type_t<Duration, seconds>>
                from_utc(const utc_time<Duration>&) noexcept;
    };
}
```

The clock `tai_clock` measures seconds since 1958-01-01 00:00:00 and is offset 10s ahead of UTC at this date. That is, 1958-01-01 00:00:00 TAI is equivalent to 1957-12-31 23:59:50 UTC. Leap seconds are not inserted into TAI. Therefore every time a leap second is inserted into UTC, UTC shifts another second with respect to TAI. For example by 2000-01-01 there had been 22 positive and 0 negative leap seconds inserted so 2000-01-01 00:00:00 UTC is equivalent to 2000-01-01 00:00:32 TAI (22s plus the initial 10s offset).

`tai_clock` is not a *Cpp17TrivialClock* unless the implementation can guarantee that `tai_clock::now()` does not propagate an exception.

NOTE `noexcept(from_utc(utc_clock::now()))` is `false`.

### 29.7.4.2 Member functions

[time.clock.tai.members]

```
static time_point now();
```

*Returns:* `from_utc(utc_clock::now())`, or a more accurate value of `tai_time`.

```
template<class Duration>
static utc_time<common_type_t<Duration, seconds>>
to_utc(const tai_time<Duration>& t) noexcept;
```

*Returns:*

```
utc_time<common_type_t<Duration, seconds>>{t.time_since_epoch()} - 378691210s
```

NOTE 1

```
378691210s == sys_days{1970y/January/1} - sys_days{1958y/January/1} + 10s
```

```
template<class Duration>
static tai_time<common_type_t<Duration, seconds>>
from_utc(const utc_time<Duration>& t) noexcept;
```

*Returns:*

```
tai_time<common_type_t<Duration, seconds>>{t.time_since_epoch()} + 378691210s
```

NOTE 2

```
378691210s == sys_days{1970y/January/1} - sys_days{1958y/January/1} + 10s
```

### 29.7.4.3 Non-member functions

[time.clock.tai.nonmembers]

```
template<class charT, class traits, class Duration>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const tai_time<Duration>& t);
```

*Effects:* Equivalent to:

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L%F %T}"), t);
```

EXAMPLE

```
auto st = sys_days{2000y/January/1};
auto tt = clock_cast<tai_clock>(st);
cout << format("{0:%F %T %Z} == {1:%F %T %Z}\n", st, tt);
```

Produces this output:

```
2000-01-01 00:00:00 UTC == 2000-01-01 00:00:32 TAI
```

```
template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
            tai_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,
            minutes* offset = nullptr);
```

*Effects:* Attempts to parse the input stream *is* into the *tai\_time* *tp* using the format flags given in the NTCTS *fmt* as specified in 29.13. If the parse fails to decode a valid date, *is.setstate(ios\_base::failbit)* is called and *tp* is not modified. If *%Z* is used and successfully parsed, that value will be assigned to *\*abbrev* if *abbrev* is non-null. If *%z* (or a modified variant) is used and successfully parsed, that value will be assigned to *\*offset* if *offset* is non-null. Additionally, the parsed offset will be subtracted from the successfully parsed timestamp prior to assigning that difference to *tp*.

*Returns:* *is*.

## 29.7.5 Class `gps_clock`

[time.clock.gps]

### 29.7.5.1 Overview

[time.clock.gps.overview]

```
namespace std::chrono {
class gps_clock {
public:
    using rep = a signed arithmetic type;
    using period = ratio<unspecified, unspecified>;
    using duration = chrono::duration<rep, period>;
    using time_point = chrono::time_point<gps_clock>;
    static constexpr bool is_steady = unspecified;

    static time_point now();
```

```

template<class Duration>
    static utc_time<common_type_t<Duration, seconds>>
        to_utc(const gps_time<Duration>&) noexcept;
template<class Duration>
    static gps_time<common_type_t<Duration, seconds>>
        from_utc(const utc_time<Duration>&) noexcept;
};
}

```

The clock `gps_clock` measures seconds since the first Sunday of January, 1980 00:00:00 UTC. Leap seconds are not inserted into GPS. Therefore every time a leap second is inserted into UTC, UTC shifts another second with respect to GPS. Aside from the offset from 1958y/January/1 to 1980y/January/Sunday[1], GPS is behind TAI by 19s due to the 10s offset between 1958 and 1970 and the additional 9 leap seconds inserted between 1970 and 1980.

`gps_clock` is not a *Cpp17TrivialClock* unless the implementation can guarantee that `gps_clock::now()` does not propagate an exception.

NOTE `noexcept(from_utc(utc_clock::now()))` is false.

### 29.7.5.2 Member functions

[time.clock.gps.members]

```
static time_point now();
```

*Returns:* `from_utc(utc_clock::now())`, or a more accurate value of `gps_time`.

```

template<class Duration>
    static utc_time<common_type_t<Duration, seconds>>
        to_utc(const gps_time<Duration>& t) noexcept;

```

*Returns:*

```
utc_time<common_type_t<Duration, seconds>>{t.time_since_epoch()} + 315964809s
```

NOTE 1

```
315964809s == sys_days{1980y/January/Sunday[1]} - sys_days{1970y/January/1} + 9s
```

```

template<class Duration>
    static gps_time<common_type_t<Duration, seconds>>
        from_utc(const utc_time<Duration>& t) noexcept;

```

*Returns:*

```
gps_time<common_type_t<Duration, seconds>>{t.time_since_epoch()} - 315964809s
```

NOTE 2

```
315964809s == sys_days{1980y/January/Sunday[1]} - sys_days{1970y/January/1} + 9s
```

### 29.7.5.3 Non-member functions

[time.clock.gps.nonmembers]

```

template<class charT, class traits, class Duration>
    basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const gps_time<Duration>& t);

```

*Effects:* Equivalent to:

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L%F %T}"), t);
```

EXAMPLE

```

auto st = sys_days{2000y/January/1};
auto gt = clock_cast<gps_clock>(st);
cout << format("{0:%F %T %Z} == {1:%F %T %Z}\n", st, gt);

```

Produces this output:

```
2000-01-01 00:00:00 UTC == 2000-01-01 00:00:13 GPS
```

```
template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
            gps_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,
            minutes* offset = nullptr);
```

*Effects:* Attempts to parse the input stream `is` into the `gps_time` `tp` using the format flags given in the NTCTS `fmt` as specified in 29.13. If the parse fails to decode a valid date, `is.setstate(ios_base::failbit)` is called and `tp` is not modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null. Additionally, the parsed offset will be subtracted from the successfully parsed timestamp prior to assigning that difference to `tp`.

*Returns:* `is`.

## 29.7.6 Type `file_clock`

[time.clock.file]

### 29.7.6.1 Overview

[time.clock.file.overview]

```
namespace std::chrono {
    using file_clock = see below;
}
```

`file_clock` is an alias for a type meeting the *Cpp17TrivialClock* requirements (29.3), and using a signed arithmetic type for `file_clock::rep`. `file_clock` is used to create the `time_point` system used for `file_time_type` (31.12). Its epoch is unspecified, and `noexcept(file_clock::now())` is true.

NOTE The type that `file_clock` denotes can be in a different namespace than `std::chrono`, such as `std::filesystem`.

### 29.7.6.2 Member functions

[time.clock.file.members]

The type denoted by `file_clock` provides precisely one of the following two sets of static member functions:

```
template<class Duration>
static sys_time<see below>
to_sys(const file_time<Duration>&);
template<class Duration>
static file_time<see below>
from_sys(const sys_time<Duration>&);
```

OR:

```
template<class Duration>
static utc_time<see below>
to_utc(const file_time<Duration>&);
template<class Duration>
static file_time<see below>
from_utc(const utc_time<Duration>&);
```

These member functions shall provide `time_point` conversions consistent with those specified by `utc_clock`, `tai_clock`, and `gps_clock`. The `Duration` of the resultant `time_point` is computed from the `Duration` of the input `time_point`.

### 29.7.6.3 Non-member functions

[time.clock.file.nonmembers]

```
template<class charT, class traits, class Duration>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const file_time<Duration>& t);
```

*Effects:* Equivalent to:

```
return os << format(os.getloc(), STatically-WIDEN<charT>("{:L%F %T}"), t);
```

```
template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
            file_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,
            minutes* offset = nullptr);
```

*Effects:* Attempts to parse the input stream `is` into the `file_time` `tp` using the format flags given in the NTCTS `fmt` as specified in 29.13. If the parse fails to decode a valid date, `is.setstate(ios_base::failbit)` is called and `tp` is not modified. If `%Z` is used and successfully parsed, that value will

be assigned to *\*abbrev* if *abbrev* is non-null. If *%z* (or a modified variant) is used and successfully parsed, that value will be assigned to *\*offset* if *offset* is non-null. Additionally, the parsed offset will be subtracted from the successfully parsed timestamp prior to assigning that difference to *tp*.

*Returns:* is.

### 29.7.7 Class `steady_clock`

[time.clock.steady]

```
namespace std::chrono {
    class steady_clock {
    public:
        using rep          = unspecified;
        using period        = ratio<unspecified, unspecified>;
        using duration      = chrono::duration<rep, period>;
        using time_point    = chrono::time_point<unspecified, duration>;
        static constexpr bool is_steady = true;

        static time_point now() noexcept;
    };
}
```

Objects of class `steady_clock` represent clocks for which values of `time_point` never decrease as physical time advances and for which values of `time_point` advance at a steady rate relative to real time. That is, the clock may not be adjusted.

### 29.7.8 Class `high_resolution_clock`

[time.clock.hires]

```
namespace std::chrono {
    class high_resolution_clock {
    public:
        using rep          = unspecified;
        using period        = ratio<unspecified, unspecified>;
        using duration      = chrono::duration<rep, period>;
        using time_point    = chrono::time_point<unspecified, duration>;
        static constexpr bool is_steady = unspecified;

        static time_point now() noexcept;
    };
}
```

Objects of class `high_resolution_clock` represent clocks with the shortest tick period. `high_resolution_clock` may be a synonym for `system_clock` or `steady_clock`.

### 29.7.9 Local time

[time.clock.local]

The family of time points denoted by `local_time<Duration>` are based on the pseudo clock `local_t`. `local_t` has no member `now()` and thus does not meet the clock requirements. Nevertheless `local_time<Duration>` serves the vital role of representing local time with respect to a not-yet-specified time zone. Aside from being able to get the current time, the complete `time_point` algebra is available for `local_time<Duration>` (just as for `sys_time<Duration>`).

```
template<class charT, class traits, class Duration>
    basic_ostream<charT, traits>&
        operator<< (basic_ostream<charT, traits>& os, const local_time<Duration>& lt);
```

*Effects:*

```
os << sys_time<Duration>{lt.time_since_epoch()};
```

*Returns:* os.

```
template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
    basic_istream<charT, traits>&
        from_stream(basic_istream<charT, traits>& is, const charT* fmt,
                    local_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,
                    minutes* offset = nullptr);
```

*Effects:* Attempts to parse the input stream *is* into the `local_time` *tp* using the format flags given in the NTCTS *fmt* as specified in 29.13. If the parse fails to decode a valid date, *is.setstate(ios\_*

`base::failbit`) is called and `tp` is not modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null.

*Returns:* `is`.

## 29.7.10 time\_point conversions [time.clock.cast]

### 29.7.10.1 Class template `clock_time_conversion` [time.clock.conv]

```
namespace std::chrono {
    template<class DestClock, class SourceClock>
    struct clock_time_conversion {};
}
```

`clock_time_conversion` serves as a trait which can be used to specify how to convert a source `time_point` of type `time_point<SourceClock, Duration>` to a destination `time_point` of type `time_point<DestClock, Duration>` via a specialization: `clock_time_conversion<DestClock, SourceClock>`. A specialization of `clock_time_conversion<DestClock, SourceClock>` shall provide a const-qualified `operator()` that takes a parameter of type `time_point<SourceClock, Duration>` and returns a `time_point<DestClock, OtherDuration>` representing an equivalent point in time. `OtherDuration` is a `chrono::duration` whose specialization is computed from the input `Duration` in a manner which can vary for each `clock_time_conversion` specialization. A program may specialize `clock_time_conversion` if at least one of the template parameters is a user-defined clock type.

Several specializations are provided by the implementation, as described in 29.7.10.2, 29.7.10.3, 29.7.10.4, and 29.7.10.5.

### 29.7.10.2 Identity conversions [time.clock.cast.id]

```
template<class Clock>
struct clock_time_conversion<Clock, Clock> {
    template<class Duration>
    time_point<Clock, Duration>
    operator()(const time_point<Clock, Duration>& t) const;
};
```

```
template<class Duration>
time_point<Clock, Duration>
operator()(const time_point<Clock, Duration>& t) const;
```

*Returns:* `t`.

```
template<>
struct clock_time_conversion<system_clock, system_clock> {
    template<class Duration>
    sys_time<Duration>
    operator()(const sys_time<Duration>& t) const;
};
```

```
template<class Duration>
sys_time<Duration>
operator()(const sys_time<Duration>& t) const;
```

*Returns:* `t`.

```
template<>
struct clock_time_conversion<utc_clock, utc_clock> {
    template<class Duration>
    utc_time<Duration>
    operator()(const utc_time<Duration>& t) const;
};
```

```
template<class Duration>
utc_time<Duration>
operator()(const utc_time<Duration>& t) const;
```

*Returns:* `t`.

**29.7.10.3 Conversions between system\_clock and utc\_clock**

[time.clock.cast.sys.utc]

```
template<>
struct clock_time_conversion<utc_clock, system_clock> {
    template<class Duration>
        utc_time<common_type_t<Duration, seconds>>
            operator()(const sys_time<Duration>& t) const;
};
```

```
template<class Duration>
    utc_time<common_type_t<Duration, seconds>>
        operator()(const sys_time<Duration>& t) const;
```

*Returns:* utc\_clock::from\_sys(t).

```
template<>
struct clock_time_conversion<system_clock, utc_clock> {
    template<class Duration>
        sys_time<common_type_t<Duration, seconds>>
            operator()(const utc_time<Duration>& t) const;
};
```

```
template<class Duration>
    sys_time<common_type_t<Duration, seconds>>
        operator()(const utc_time<Duration>& t) const;
```

*Returns:* utc\_clock::to\_sys(t).

**29.7.10.4 Conversions between system\_clock and other clocks**

[time.clock.cast.sys]

```
template<class SourceClock>
struct clock_time_conversion<system_clock, SourceClock> {
    template<class Duration>
        auto operator()(const time_point<SourceClock, Duration>& t) const
            -> decltype(SourceClock::to_sys(t));
};
```

```
template<class Duration>
    auto operator()(const time_point<SourceClock, Duration>& t) const
        -> decltype(SourceClock::to_sys(t));
```

*Constraints:* SourceClock::to\_sys(t) is well-formed.

*Mandates:* SourceClock::to\_sys(t) returns a sys\_time<Duration2> for some type Duration2 (29.6.1).

*Returns:* SourceClock::to\_sys(t).

```
template<class DestClock>
struct clock_time_conversion<DestClock, system_clock> {
    template<class Duration>
        auto operator()(const sys_time<Duration>& t) const
            -> decltype(DestClock::from_sys(t));
};
```

```
template<class Duration>
    auto operator()(const sys_time<Duration>& t) const
        -> decltype(DestClock::from_sys(t));
```

*Constraints:* DestClock::from\_sys(t) is well-formed.

*Mandates:* DestClock::from\_sys(t) returns a time\_point<DestClock, Duration2> for some type Duration2 (29.6.1).

*Returns:* DestClock::from\_sys(t).

**29.7.10.5 Conversions between utc\_clock and other clocks****[time.clock.cast.utc]**

```

template<class SourceClock>
struct clock_time_conversion<utc_clock, SourceClock> {
    template<class Duration>
        auto operator()(const time_point<SourceClock, Duration>& t) const
            -> decltype(SourceClock::to_utc(t));
};

template<class Duration>
auto operator()(const time_point<SourceClock, Duration>& t) const
    -> decltype(SourceClock::to_utc(t));

Constraints: SourceClock::to_utc(t) is well-formed.

Mandates: SourceClock::to_utc(t) returns a utc_time<Duration2> for some type Duration2
(29.6.1).

Returns: SourceClock::to_utc(t).

template<class DestClock>
struct clock_time_conversion<DestClock, utc_clock> {
    template<class Duration>
        auto operator()(const utc_time<Duration>& t) const
            -> decltype(DestClock::from_utc(t));
};

template<class Duration>
auto operator()(const utc_time<Duration>& t) const
    -> decltype(DestClock::from_utc(t));

Constraints: DestClock::from_utc(t) is well-formed.

Mandates: DestClock::from_utc(t) returns a time_point<DestClock, Duration2> for some type
Duration2 (29.6.1).

Returns: DestClock::from_utc(t).

```

**29.7.10.6 Function template clock\_cast****[time.clock.cast.fn]**

```

template<class DestClock, class SourceClock, class Duration>
auto clock_cast(const time_point<SourceClock, Duration>& t);

Constraints: At least one of the following clock time conversion expressions is well-formed:
    — clock_time_conversion<DestClock, SourceClock>{}(t)
    — clock_time_conversion<DestClock, system_clock>{}(
        clock_time_conversion<system_clock, SourceClock>{}(t))
    — clock_time_conversion<DestClock, utc_clock>{}(
        clock_time_conversion<utc_clock, SourceClock>{}(t))
    — clock_time_conversion<DestClock, utc_clock>{}(
        clock_time_conversion<utc_clock, system_clock>{}(
            clock_time_conversion<system_clock, SourceClock>{}(t)))
    — clock_time_conversion<DestClock, system_clock>{}(
        clock_time_conversion<system_clock, utc_clock>{}(
            clock_time_conversion<utc_clock, SourceClock>{}(t)))

```

A clock time conversion expression is considered better than another clock time conversion expression if it involves fewer operator() calls on clock\_time\_conversion specializations.

*Mandates:* Among the well-formed clock time conversion expressions from the above list, there is a unique best expression.

*Returns:* The best well-formed clock time conversion expression in the above list.

**29.8 The civil calendar****[time.cal]****29.8.1 General****[time.cal.general]**

The types in 29.8 describe the civil (Gregorian) calendar and its relationship to sys\_days and local\_days.

**29.8.2 Class last\_spec****[time.cal.last]**

```
namespace std::chrono {
    struct last_spec {
        explicit last_spec() = default;
    };
}
```

The type `last_spec` is used in conjunction with other calendar types to specify the last in a sequence. For example, depending on context, it can represent the last day of a month, or the last day of the week of a month.

**29.8.3 Class day****[time.cal.day]****29.8.3.1 Overview****[time.cal.day.overview]**

```
namespace std::chrono {
    class day {
        unsigned char d_;           // exposition only
    public:
        day() = default;
        constexpr explicit day(unsigned d) noexcept;

        constexpr day& operator++()    noexcept;
        constexpr day  operator++(int) noexcept;
        constexpr day& operator--()    noexcept;
        constexpr day  operator--(int) noexcept;

        constexpr day& operator+=(const days& d) noexcept;
        constexpr day& operator-=(const days& d) noexcept;

        constexpr explicit operator unsigned() const noexcept;
        constexpr bool ok() const noexcept;
    };
}
```

`day` represents a day of a month. It normally holds values in the range 1 to 31, but may hold non-negative values outside this range. It can be constructed with any `unsigned` value, which will be subsequently truncated to fit into `day`'s unspecified internal storage. `day` meets the *Cpp17EqualityComparable* (Table 28) and *Cpp17LessThanComparable* (Table 29) requirements, and participates in basic arithmetic with `days` objects, which represent a difference between two `day` objects.

`day` is a trivially copyable and standard-layout class type.

**29.8.3.2 Member functions****[time.cal.day.members]**

```
constexpr explicit day(unsigned d) noexcept;
```

*Effects:* Initializes `d_` with `d`. The value held is unspecified if `d` is not in the range `[0, 255]`.

```
constexpr day& operator++() noexcept;
```

*Effects:* `++d_`.

*Returns:* `*this`.

```
constexpr day operator++(int) noexcept;
```

*Effects:* `++(*this)`.

*Returns:* A copy of `*this` as it existed on entry to this member function.

```
constexpr day& operator--() noexcept;
```

*Effects:* Equivalent to: `--d_`.

*Returns:* `*this`.

```
constexpr day operator--(int) noexcept;
```

*Effects:* `--(*this)`.

*Returns:* A copy of `*this` as it existed on entry to this member function.

```
constexpr day& operator+=(const days& d) noexcept;
```

*Effects:* `*this = *this + d.`

*Returns:* `*this.`

```
constexpr day& operator-=(const days& d) noexcept;
```

*Effects:* `*this = *this - d.`

*Returns:* `*this.`

```
constexpr explicit operator unsigned() const noexcept;
```

*Returns:* `d_.`

```
constexpr bool ok() const noexcept;
```

*Returns:* `1 <= d_ && d_ <= 31.`

### 29.8.3.3 Non-member functions

[time.cal.day.nonmembers]

```
constexpr bool operator==(const day& x, const day& y) noexcept;
```

*Returns:* `unsigned{x} == unsigned{y}.`

```
constexpr strong_ordering operator<=(const day& x, const day& y) noexcept;
```

*Returns:* `unsigned{x} <= unsigned{y}.`

```
constexpr day operator+(const day& x, const days& y) noexcept;
```

*Returns:* `day(unsigned{x} + y.count()).`

```
constexpr day operator+(const days& x, const day& y) noexcept;
```

*Returns:* `y + x.`

```
constexpr day operator-(const day& x, const days& y) noexcept;
```

*Returns:* `x + -y.`

```
constexpr days operator-(const day& x, const day& y) noexcept;
```

*Returns:* `days{int(unsigned{x}) - int(unsigned{y})}.`

```
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const day& d);
```

*Effects:* Equivalent to:

```
return os << (d.ok() ?
    format(STATICALLY-WIDEN<charT>("{:%d}"), d) :
    format(STATICALLY-WIDEN<charT>("{:%d} is not a valid day"), d));
```

```
template<class charT, class traits, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
    day& d, basic_string<charT, traits, Alloc>* abbrev = nullptr,
    minutes* offset = nullptr);
```

*Effects:* Attempts to parse the input stream `is` into the day `d` using the format flags given in the NTCTS `fmt` as specified in 29.13. If the parse fails to decode a valid day, `is.setstate(ios_base::failbit)` is called and `d` is not modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null.

*Returns:* `is.`

```
constexpr chrono::day operator""d(unsigned long long d) noexcept;
```

*Returns:* `day{static_cast<unsigned>(d)}.`

## 29.8.4 Class month

[time.cal.month]

### 29.8.4.1 Overview

[time.cal.month.overview]

```

namespace std::chrono {
    class month {
        unsigned char m_;           // exposition only
    public:
        month() = default;
        constexpr explicit month(unsigned m) noexcept;

        constexpr month& operator++()    noexcept;
        constexpr month operator++(int) noexcept;
        constexpr month& operator--()    noexcept;
        constexpr month operator--(int) noexcept;

        constexpr month& operator+=(const months& m) noexcept;
        constexpr month& operator-=(const months& m) noexcept;

        constexpr explicit operator unsigned() const noexcept;
        constexpr bool ok() const noexcept;
    };
}

```

**month** represents a month of a year. It normally holds values in the range 1 to 12, but may hold non-negative values outside this range. It can be constructed with any **unsigned** value, which will be subsequently truncated to fit into **month**'s unspecified internal storage. **month** meets the *Cpp17EqualityComparable* (Table 28) and *Cpp17LessThanComparable* (Table 29) requirements, and participates in basic arithmetic with **months** objects, which represent a difference between two **month** objects.

**month** is a trivially copyable and standard-layout class type.

### 29.8.4.2 Member functions

[time.cal.month.members]

```
constexpr explicit month(unsigned m) noexcept;
```

*Effects:* Initializes **m\_** with **m**. The value held is unspecified if **m** is not in the range [0, 255].

```
constexpr month& operator++() noexcept;
```

*Effects:* **\*this += months{1}**.

*Returns:* **\*this**.

```
constexpr month operator++(int) noexcept;
```

*Effects:* **++(\*this)**.

*Returns:* A copy of **\*this** as it existed on entry to this member function.

```
constexpr month& operator--() noexcept;
```

*Effects:* **\*this -= months{1}**.

*Returns:* **\*this**.

```
constexpr month operator--(int) noexcept;
```

*Effects:* **--(\*this)**.

*Returns:* A copy of **\*this** as it existed on entry to this member function.

```
constexpr month& operator+=(const months& m) noexcept;
```

*Effects:* **\*this = \*this + m**.

*Returns:* **\*this**.

```
constexpr month& operator-=(const months& m) noexcept;
```

*Effects:* **\*this = \*this - m**.

*Returns:* **\*this**.

```
constexpr explicit operator unsigned() const noexcept;
```

*Returns:* `m_`.

```
constexpr bool ok() const noexcept;
```

*Returns:* `1 <= m_ && m_ <= 12`.

### 29.8.4.3 Non-member functions

[time.cal.month.nonmembers]

```
constexpr bool operator==(const month& x, const month& y) noexcept;
```

*Returns:* `unsigned{x} == unsigned{y}`.

```
constexpr strong_ordering operator<=>(const month& x, const month& y) noexcept;
```

*Returns:* `unsigned{x} <=> unsigned{y}`.

```
constexpr month operator+(const month& x, const months& y) noexcept;
```

*Returns:*

```
month{modulo(static_cast<long long>(unsigned{x}) + (y.count() - 1), 12) + 1}
```

where `modulo(n, 12)` computes the remainder of `n` divided by 12 using Euclidean division.

NOTE Given a divisor of 12, Euclidean division truncates towards negative infinity and always produces a remainder in the range of `[0, 11]`. Assuming no overflow in the signed summation, this operation results in a `month` holding a value in the range `[1, 12]` even if `!x.ok()`.

EXAMPLE 1 February + months{11} == January.

```
constexpr month operator+(const months& x, const month& y) noexcept;
```

*Returns:* `y + x`.

```
constexpr month operator-(const month& x, const months& y) noexcept;
```

*Returns:* `x + -y`.

```
constexpr months operator-(const month& x, const month& y) noexcept;
```

*Returns:* If `x.ok() == true` and `y.ok() == true`, returns a value `m` in the range `[months{0}, months{11}]` satisfying `y + m == x`. Otherwise the value returned is unspecified.

EXAMPLE 2 January - February == months{11}.

```
template<class charT, class traits>
```

```
basic_ostream<charT, traits>&
```

```
operator<<(basic_ostream<charT, traits>& os, const month& m);
```

*Effects:* Equivalent to:

```
return os << (m.ok() ?
    format(os.getloc(), STATICALLY-WIDEN<charT>("{:L%b}"), m) :
    format(os.getloc(), STATICALLY-WIDEN<charT>("{} is not a valid month"),
        static_cast<unsigned>(m)));
```

```
template<class charT, class traits, class Alloc = allocator<charT>>
```

```
basic_istream<charT, traits>&
```

```
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
    month& m, basic_string<charT, traits, Alloc>* abbrev = nullptr,
    minutes* offset = nullptr);
```

*Effects:* Attempts to parse the input stream `is` into the month `m` using the format flags given in the NTCTS `fmt` as specified in 29.13. If the parse fails to decode a valid month, `is.setstate(ios_base::failbit)` is called and `m` is not modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null.

*Returns:* `is`.

**29.8.5 Class year****[time.cal.year]****29.8.5.1 Overview****[time.cal.year.overview]**

```

namespace std::chrono {
    class year {
        short y_;           // exposition only
    public:
        year() = default;
        constexpr explicit year(int y) noexcept;

        constexpr year& operator++()    noexcept;
        constexpr year  operator++(int) noexcept;
        constexpr year& operator--()    noexcept;
        constexpr year  operator--(int) noexcept;

        constexpr year& operator+=(const years& y) noexcept;
        constexpr year& operator-=(const years& y) noexcept;

        constexpr year operator+() const noexcept;
        constexpr year operator-() const noexcept;

        constexpr bool is_leap() const noexcept;

        constexpr explicit operator int() const noexcept;
        constexpr bool ok() const noexcept;

        static constexpr year min() noexcept;
        static constexpr year max() noexcept;
    };
}

```

**year** represents a year in the civil calendar. It can represent values in the range `[min(),max()]`. It can be constructed with any `int` value, which will be subsequently truncated to fit into **year**'s unspecified internal storage. **year** meets the *Cpp17EqualityComparable* (Table 28) and *Cpp17LessThanComparable* (Table 29) requirements, and participates in basic arithmetic with **years** objects, which represent a difference between two **year** objects.

**year** is a trivially copyable and standard-layout class type.

**29.8.5.2 Member functions****[time.cal.year.members]**

```
constexpr explicit year(int y) noexcept;
```

*Effects:* Initializes `y_` with `y`. The value held is unspecified if `y` is not in the range `[-32767, 32767]`.

```
constexpr year& operator++() noexcept;
```

*Effects:* `++y_`.

*Returns:* `*this`.

```
constexpr year& operator++(int) noexcept;
```

*Effects:* `++(*this)`.

*Returns:* A copy of `*this` as it existed on entry to this member function.

```
constexpr year& operator--() noexcept;
```

*Effects:* `--y_`.

*Returns:* `*this`.

```
constexpr year operator--(int) noexcept;
```

*Effects:* `--(*this)`.

*Returns:* A copy of `*this` as it existed on entry to this member function.

```
constexpr year& operator+=(const years& y) noexcept;
```

*Effects:* `*this = *this + y.`

*Returns:* `*this.`

```
constexpr year& operator-=(const years& y) noexcept;
```

*Effects:* `*this = *this - y.`

*Returns:* `*this.`

```
constexpr year operator+() const noexcept;
```

*Returns:* `*this.`

```
constexpr year operator-() const noexcept;
```

*Returns:* `year{-y_}.`

```
constexpr bool is_leap() const noexcept;
```

*Returns:* `y_ % 4 == 0 && (y_ % 100 != 0 || y_ % 400 == 0).`

```
constexpr explicit operator int() const noexcept;
```

*Returns:* `y_.`

```
constexpr bool ok() const noexcept;
```

*Returns:* `min().y_ <= y_ && y_ <= max().y_.`

```
static constexpr year min() noexcept;
```

*Returns:* `year{-32767}.`

```
static constexpr year max() noexcept;
```

*Returns:* `year{32767}.`

### 29.8.5.3 Non-member functions

[time.cal.year.nonmembers]

```
constexpr bool operator==(const year& x, const year& y) noexcept;
```

*Returns:* `int{x} == int{y}.`

```
constexpr strong_ordering operator<=>(const year& x, const year& y) noexcept;
```

*Returns:* `int{x} <=> int{y}.`

```
constexpr year operator+(const year& x, const years& y) noexcept;
```

*Returns:* `year{int{x} + static_cast<int>(y.count())}.`

```
constexpr year operator+(const years& x, const year& y) noexcept;
```

*Returns:* `y + x.`

```
constexpr year operator-(const year& x, const years& y) noexcept;
```

*Returns:* `x + -y.`

```
constexpr years operator-(const year& x, const year& y) noexcept;
```

*Returns:* `years{int{x} - int{y}}.`

```
template<class charT, class traits>
```

```
basic_ostream<charT, traits>&
```

```
operator<<(basic_ostream<charT, traits>& os, const year& y);
```

*Effects:* Equivalent to:

```
return os << (y.ok() ?
```

```
format(STATICALLY-WIDEN<charT>("{:%Y}"), y) :
```

```
format(STATICALLY-WIDEN<charT>("{:%Y} is not a valid year"), y));
```

```
template<class charT, class traits, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
            year& y, basic_string<charT, traits, Alloc>* abbrev = nullptr,
            minutes* offset = nullptr);
```

*Effects:* Attempts to parse the input stream *is* into the *year* *y* using the format flags given in the NTCTS *fmt* as specified in 29.13. If the parse fails to decode a valid year, *is.setstate(ios\_base::failbit)* is called and *y* is not modified. If *%Z* is used and successfully parsed, that value will be assigned to *\*abbrev* if *abbrev* is non-null. If *%z* (or a modified variant) is used and successfully parsed, that value will be assigned to *\*offset* if *offset* is non-null.

*Returns:* *is*.

```
constexpr chrono::year operator""y(unsigned long long y) noexcept;
```

*Returns:* *year{static\_cast<int>(y)}*.

## 29.8.6 Class *weekday*

[time.cal.wd]

### 29.8.6.1 Overview

[time.cal.wd.overview]

```
namespace std::chrono {
class weekday {
    unsigned char wd_;           // exposition only
public:
    weekday() = default;
    constexpr explicit weekday(unsigned wd) noexcept;
    constexpr weekday(const sys_days& dp) noexcept;
    constexpr explicit weekday(const local_days& dp) noexcept;

    constexpr weekday& operator++() noexcept;
    constexpr weekday operator++(int) noexcept;
    constexpr weekday& operator--() noexcept;
    constexpr weekday operator--(int) noexcept;

    constexpr weekday& operator+=(const days& d) noexcept;
    constexpr weekday& operator-=(const days& d) noexcept;

    constexpr unsigned c_encoding() const noexcept;
    constexpr unsigned iso_encoding() const noexcept;
    constexpr bool ok() const noexcept;

    constexpr weekday_indexed operator[](unsigned index) const noexcept;
    constexpr weekday_last operator[](last_spec) const noexcept;
};
}
```

*weekday* represents a day of the week in the civil calendar. It normally holds values in the range 0 to 6, corresponding to Sunday through Saturday, but it may hold non-negative values outside this range. It can be constructed with any *unsigned* value, which will be subsequently truncated to fit into *weekday*'s unspecified internal storage. *weekday* meets the *Cpp17EqualityComparable* (Table 28) requirements.

NOTE *weekday* is not *Cpp17LessThanComparable* because there is no universal consensus on which day is the first day of the week. *weekday*'s arithmetic operations treat the days of the week as a circular range, with no beginning and no end.

*weekday* is a trivially copyable and standard-layout class type.

### 29.8.6.2 Member functions

[time.cal.wd.members]

```
constexpr explicit weekday(unsigned wd) noexcept;
```

*Effects:* Initializes *wd\_* with *wd == 7 ? 0 : wd*. The value held is unspecified if *wd* is not in the range [0, 255].

```
constexpr weekday(const sys_days& dp) noexcept;
```

*Effects:* Computes what day of the week corresponds to the *sys\_days* *dp*, and initializes that day of the week in *wd\_*.

EXAMPLE If `dp` represents 1970-01-01, the constructed `weekday` represents Thursday by storing 4 in `wd_`.

```
constexpr explicit weekday(const local_days& dp) noexcept;
```

*Effects:* Computes what day of the week corresponds to the `local_days` `dp`, and initializes that day of the week in `wd_`.

*Postconditions:* The value is identical to that constructed from `sys_days{dp.time_since_epoch()}`.

```
constexpr weekday& operator++() noexcept;
```

*Effects:* `*this += days{1}`.

*Returns:* `*this`.

```
constexpr weekday operator++(int) noexcept;
```

*Effects:* `++(*this)`.

*Returns:* A copy of `*this` as it existed on entry to this member function.

```
constexpr weekday& operator--() noexcept;
```

*Effects:* `*this -= days{1}`.

*Returns:* `*this`.

```
constexpr weekday operator--(int) noexcept;
```

*Effects:* `--(*this)`.

*Returns:* A copy of `*this` as it existed on entry to this member function.

```
constexpr weekday& operator+=(const days& d) noexcept;
```

*Effects:* `*this = *this + d`.

*Returns:* `*this`.

```
constexpr weekday& operator-=(const days& d) noexcept;
```

*Effects:* `*this = *this - d`.

*Returns:* `*this`.

```
constexpr unsigned c_encoding() const noexcept;
```

*Returns:* `wd_`.

```
constexpr unsigned iso_encoding() const noexcept;
```

*Returns:* `wd_ == 0u ? 7u : wd_`.

```
constexpr bool ok() const noexcept;
```

*Returns:* `wd_ <= 6`.

```
constexpr weekday_indexed operator[](unsigned index) const noexcept;
```

*Returns:* `{*this, index}`.

```
constexpr weekday_last operator[](last_spec) const noexcept;
```

*Returns:* `weekday_last{*this}`.

### 29.8.6.3 Non-member functions

[time.cal.wd.nonmembers]

```
constexpr bool operator==(const weekday& x, const weekday& y) noexcept;
```

*Returns:* `x.wd_ == y.wd_`.

```
constexpr weekday operator+(const weekday& x, const days& y) noexcept;
```

*Returns:*

`weekday{modulo(static_cast<long long>(x.wd_) + y.count(), 7)}`

where `modulo(n, 7)` computes the remainder of `n` divided by 7 using Euclidean division.

NOTE Given a divisor of 7, Euclidean division truncates towards negative infinity and always produces a remainder in the range of  $[0, 6]$ . Assuming no overflow in the signed summation, this operation results in a `weekday` holding a value in the range  $[0, 6]$  even if `!x.ok()`.

EXAMPLE 1 `Monday + days{6} == Sunday`.

```
constexpr weekday operator+(const days& x, const weekday& y) noexcept;
```

*Returns:* `y + x`.

```
constexpr weekday operator-(const weekday& x, const days& y) noexcept;
```

*Returns:* `x + -y`.

```
constexpr days operator-(const weekday& x, const weekday& y) noexcept;
```

*Returns:* If `x.ok() == true` and `y.ok() == true`, returns a value `d` in the range  $[\text{days}\{0\}, \text{days}\{6\}]$  satisfying `y + d == x`. Otherwise the value returned is unspecified.

EXAMPLE 2 `Sunday - Monday == days{6}`.

```
template<class charT, class traits>
```

```
basic_ostream<charT, traits>&
```

```
operator<<(basic_ostream<charT, traits>& os, const weekday& wd);
```

*Effects:* Equivalent to:

```
return os << (wd.ok() ?
    format(os.getloc(), STATICALLY-WIDEN<charT>("{:L%a}"), wd) :
    format(os.getloc(), STATICALLY-WIDEN<charT>("{} is not a valid weekday"),
        static_cast<unsigned>(wd.wd_)));
```

```
template<class charT, class traits, class Alloc = allocator<charT>>
```

```
basic_istream<charT, traits>&
```

```
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
    weekday& wd, basic_string<charT, traits, Alloc>* abbrev = nullptr,
    minutes* offset = nullptr);
```

*Effects:* Attempts to parse the input stream `is` into the `weekday wd` using the format flags given in the NTCTS `fmt` as specified in 29.13. If the parse fails to decode a valid weekday, `is.setstate(ios_base::failbit)` is called and `wd` is not modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null.

*Returns:* `is`.

## 29.8.7 Class `weekday_indexed`

[time.cal.wdidx]

### 29.8.7.1 Overview

[time.cal.wdidx.overview]

```
namespace std::chrono {
    class weekday_indexed {
        chrono::weekday wd_; // exposition only
        unsigned char index_; // exposition only

    public:
        weekday_indexed() = default;
        constexpr weekday_indexed(const chrono::weekday& wd, unsigned index) noexcept;

        constexpr chrono::weekday weekday() const noexcept;
        constexpr unsigned index() const noexcept;
        constexpr bool ok() const noexcept;
    };
}
```

`weekday_indexed` represents a `weekday` and a small index in the range 1 to 5. This class is used to represent the first, second, third, fourth, or fifth weekday of a month.

NOTE A `weekday_indexed` object can be constructed by indexing a `weekday` with an `unsigned`.

EXAMPLE

```
constexpr auto wdi = Sunday[2]; // wdi is the second Sunday of an as yet unspecified month
```

```
static_assert(wdi.weekday() == Sunday);
static_assert(wdi.index() == 2);
```

`weekday_indexed` is a trivially copyable and standard-layout class type.

### 29.8.7.2 Member functions

[time.cal.wdidx.members]

```
constexpr weekday_indexed(const chrono::weekday& wd, unsigned index) noexcept;
```

*Effects:* Initializes `wd_` with `wd` and `index_` with `index`. The values held are unspecified if `!wd.ok()` or `index` is not in the range `[0, 7]`.

```
constexpr chrono::weekday weekday() const noexcept;
```

*Returns:* `wd_`.

```
constexpr unsigned index() const noexcept;
```

*Returns:* `index_`.

```
constexpr bool ok() const noexcept;
```

*Returns:* `wd_.ok() && 1 <= index_ && index_ <= 5`.

### 29.8.7.3 Non-member functions

[time.cal.wdidx.nonmembers]

```
constexpr bool operator==(const weekday_indexed& x, const weekday_indexed& y) noexcept;
```

*Returns:* `x.weekday() == y.weekday() && x.index() == y.index()`.

```
template<class charT, class traits>
```

```
basic_ostream<charT, traits>&
```

```
operator<<(basic_ostream<charT, traits>& os, const weekday_indexed& wdi);
```

*Effects:* Equivalent to:

```
auto i = wdi.index();
return os << (i >= 1 && i <= 5 ?
    format(os.getloc(), STATIONALLY-WIDEN<charT>("{:L}[{}]", wdi.weekday(), i) :
    format(os.getloc(), STATIONALLY-WIDEN<charT>("{:L}[{} is not a valid index]",
        wdi.weekday(), i));
```

## 29.8.8 Class `weekday_last`

[time.cal.wdlast]

### 29.8.8.1 Overview

[time.cal.wdlast.overview]

```
namespace std::chrono {
    class weekday_last {
        chrono::weekday wd_; // exposition only

    public:
        constexpr explicit weekday_last(const chrono::weekday& wd) noexcept;

        constexpr chrono::weekday weekday() const noexcept;
        constexpr bool ok() const noexcept;
    };
}
```

`weekday_last` represents the last weekday of a month.

NOTE A `weekday_last` object can be constructed by indexing a `weekday` with `last`.

EXAMPLE

```
constexpr auto wdl = Sunday[last]; // wdl is the last Sunday of an as yet unspecified month
static_assert(wdl.weekday() == Sunday);
```

`weekday_last` is a trivially copyable and standard-layout class type.

### 29.8.8.2 Member functions

[time.cal.wdlast.members]

```
constexpr explicit weekday_last(const chrono::weekday& wd) noexcept;
```

*Effects:* Initializes `wd_` with `wd`.

```
constexpr chrono::weekday weekday() const noexcept;
```

*Returns:* `wd_`.

```
constexpr bool ok() const noexcept;
```

*Returns:* `wd_.ok()`.

### 29.8.8.3 Non-member functions

[time.cal.wdlast.nonmembers]

```
constexpr bool operator==(const weekday_last& x, const weekday_last& y) noexcept;
```

*Returns:* `x.weekday() == y.weekday()`.

```
template<class charT, class traits>
```

```
basic_ostream<charT, traits>&
```

```
operator<<(basic_ostream<charT, traits>& os, const weekday_last& wdl);
```

*Effects:* Equivalent to:

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L}[last]"), wdl.weekday());
```

## 29.8.9 Class month\_day

[time.cal.md]

### 29.8.9.1 Overview

[time.cal.md.overview]

```
namespace std::chrono {
```

```
class month_day {
```

```
    chrono::month m_;           // exposition only
```

```
    chrono::day d_;             // exposition only
```

```
public:
```

```
    month_day() = default;
```

```
    constexpr month_day(const chrono::month& m, const chrono::day& d) noexcept;
```

```
    constexpr chrono::month month() const noexcept;
```

```
    constexpr chrono::day day() const noexcept;
```

```
    constexpr bool ok() const noexcept;
```

```
};
```

```
}
```

`month_day` represents a specific day of a specific month, but with an unspecified year. `month_day` meets the *Cpp17EqualityComparable* (Table 28) and *Cpp17LessThanComparable* (Table 29) requirements.

`month_day` is a trivially copyable and standard-layout class type.

### 29.8.9.2 Member functions

[time.cal.md.members]

```
constexpr month_day(const chrono::month& m, const chrono::day& d) noexcept;
```

*Effects:* Initializes `m_` with `m`, and `d_` with `d`.

```
constexpr chrono::month month() const noexcept;
```

*Returns:* `m_`.

```
constexpr chrono::day day() const noexcept;
```

*Returns:* `d_`.

```
constexpr bool ok() const noexcept;
```

*Returns:* `true` if `m_.ok()` is `true`, `1d <= d_`, and `d_` is less than or equal to the number of days in month `m_`; otherwise returns `false`. When `m_ == February`, the number of days is considered to be 29.

### 29.8.9.3 Non-member functions

[time.cal.md.nonmembers]

```
constexpr bool operator==(const month_day& x, const month_day& y) noexcept;
```

*Returns:* `x.month() == y.month() && x.day() == y.day()`.

```
constexpr strong_ordering operator<=>(const month_day& x, const month_day& y) noexcept;
```

*Effects:* Equivalent to:

```
if (auto c = x.month() <=> y.month(); c != 0) return c;
return x.day() <=> y.day();
```

```
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const month_day& md);
```

*Effects:* Equivalent to:

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L}/{:}",
md.month(), md.day());
```

```
template<class charT, class traits, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
month_day& md, basic_string<charT, traits, Alloc>* abbrev = nullptr,
minutes* offset = nullptr);
```

*Effects:* Attempts to parse the input stream *is* into the *month\_day* *md* using the format flags given in the NTCTS *fmt* as specified in 29.13. If the parse fails to decode a valid *month\_day*, *is.setstate(ios\_base::failbit)* is called and *md* is not modified. If *%Z* is used and successfully parsed, that value will be assigned to *\*abbrev* if *abbrev* is non-null. If *%z* (or a modified variant) is used and successfully parsed, that value will be assigned to *\*offset* if *offset* is non-null.

*Returns:* *is*.

### 29.8.10 Class *month\_day\_last*

[time.cal.mdlast]

```
namespace std::chrono {
class month_day_last {
    chrono::month m_; // exposition only

public:
    constexpr explicit month_day_last(const chrono::month& m) noexcept;

    constexpr chrono::month month() const noexcept;
    constexpr bool ok() const noexcept;
};
}
```

*month\_day\_last* represents the last day of a month.

NOTE A *month\_day\_last* object can be constructed using the expression *m/last* or *last/m*, where *m* is an expression of type *month*.

EXAMPLE

```
constexpr auto mdl = February/last; // mdl is the last day of February of an as yet unspecified year
static_assert(mdl.month() == February);
```

*month\_day\_last* is a trivially copyable and standard-layout class type.

```
constexpr explicit month_day_last(const chrono::month& m) noexcept;
```

*Effects:* Initializes *m\_* with *m*.

```
constexpr month month() const noexcept;
```

*Returns:* *m\_*.

```
constexpr bool ok() const noexcept;
```

*Returns:* *m\_.ok()*.

```
constexpr bool operator==(const month_day_last& x, const month_day_last& y) noexcept;
```

*Returns:* *x.month() == y.month()*.

```
constexpr strong_ordering operator<=>(const month_day_last& x, const month_day_last& y) noexcept;
    Returns: x.month() <=> y.month().
```

```
template<class charT, class traits>
    basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const month_day_last& mdl);
    Effects: Equivalent to:
        return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L}/last"), mdl.month());
```

## 29.8.11 Class month\_weekday

[time.cal.mwd]

### 29.8.11.1 Overview

[time.cal.mwd.overview]

```
namespace std::chrono {
    class month_weekday {
        chrono::month m_; // exposition only
        chrono::weekday_indexed wdi_; // exposition only
    public:
        constexpr month_weekday(const chrono::month& m, const chrono::weekday_indexed& wdi) noexcept;

        constexpr chrono::month month() const noexcept;
        constexpr chrono::weekday_indexed weekday_indexed() const noexcept;
        constexpr bool ok() const noexcept;
    };
}
```

month\_weekday represents the  $n^{\text{th}}$  weekday of a month, of an as yet unspecified year. To do this the month\_weekday stores a month and a weekday\_indexed.

EXAMPLE

```
constexpr auto mwd
    = February/Tuesday[3]; // mwd is the third Tuesday of February of an as yet unspecified year
static_assert(mwd.month() == February);
static_assert(mwd.weekday_indexed() == Tuesday[3]);
```

month\_weekday is a trivially copyable and standard-layout class type.

### 29.8.11.2 Member functions

[time.cal.mwd.members]

```
constexpr month_weekday(const chrono::month& m, const chrono::weekday_indexed& wdi) noexcept;
```

Effects: Initializes m\_ with m and wdi\_ with wdi.

```
constexpr chrono::month month() const noexcept;
```

Returns: m\_.

```
constexpr chrono::weekday_indexed weekday_indexed() const noexcept;
```

Returns: wdi\_.

```
constexpr bool ok() const noexcept;
```

Returns: m\_.ok() && wdi\_.ok().

### 29.8.11.3 Non-member functions

[time.cal.mwd.nonmembers]

```
constexpr bool operator==(const month_weekday& x, const month_weekday& y) noexcept;
```

Returns: x.month() == y.month() && x.weekday\_indexed() == y.weekday\_indexed().

```
template<class charT, class traits>
    basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const month_weekday& mwd);
    Effects: Equivalent to:
        return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L}/{:L}"),
            mwd.month(), mwd.weekday_indexed());
```

**29.8.12 Class month\_weekday\_last****[time.cal.mwdlast]****29.8.12.1 Overview****[time.cal.mwdlast.overview]**

```

namespace std::chrono {
    class month_weekday_last {
        chrono::month      m_;      // exposition only
        chrono::weekday_last wdl_;   // exposition only
    public:
        constexpr month_weekday_last(const chrono::month& m,
                                     const chrono::weekday_last& wdl) noexcept;

        constexpr chrono::month      month()      const noexcept;
        constexpr chrono::weekday_last weekday_last() const noexcept;
        constexpr bool ok() const noexcept;
    };
}

```

`month_weekday_last` represents the last weekday of a month, of an as yet unspecified year. To do this the `month_weekday_last` stores a month and a `weekday_last`.

EXAMPLE

```

constexpr auto mwd
    = February/Tuesday[last];    // mwd is the last Tuesday of February of an as yet unspecified year
static_assert(mwd.month() == February);
static_assert(mwd.weekday_last() == Tuesday[last]);

```

`month_weekday_last` is a trivially copyable and standard-layout class type.

**29.8.12.2 Member functions****[time.cal.mwdlast.members]**

```

constexpr month_weekday_last(const chrono::month& m,
                             const chrono::weekday_last& wdl) noexcept;

```

*Effects:* Initializes `m_` with `m`, and `wdl_` with `wdl`.

```

constexpr chrono::month month() const noexcept;

```

*Returns:* `m_`.

```

constexpr chrono::weekday_last weekday_last() const noexcept;

```

*Returns:* `wdl_`.

```

constexpr bool ok() const noexcept;

```

*Returns:* `m_.ok()` && `wdl_.ok()`.

**29.8.12.3 Non-member functions****[time.cal.mwdlast.nonmembers]**

```

constexpr bool operator==(const month_weekday_last& x, const month_weekday_last& y) noexcept;

```

*Returns:* `x.month() == y.month()` && `x.weekday_last() == y.weekday_last()`.

```

template<class charT, class traits>
    basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const month_weekday_last& mwdl);

```

*Effects:* Equivalent to:

```

return os << format(os.getloc(), STatically-WIDEN<charT>("{:L}/{:L}"),
                    mwdl.month(), mwdl.weekday_last());

```

**29.8.13 Class year\_month****[time.cal.ym]****29.8.13.1 Overview****[time.cal.ym.overview]**

```

namespace std::chrono {
    class year_month {
        chrono::year  y_;      // exposition only
        chrono::month m_;      // exposition only
    };
}

```

```

public:
    year_month() = default;
    constexpr year_month(const chrono::year& y, const chrono::month& m) noexcept;

    constexpr chrono::year year() const noexcept;
    constexpr chrono::month month() const noexcept;

    constexpr year_month& operator+=(const months& dm) noexcept;
    constexpr year_month& operator-=(const months& dm) noexcept;
    constexpr year_month& operator+=(const years& dy) noexcept;
    constexpr year_month& operator-=(const years& dy) noexcept;

    constexpr bool ok() const noexcept;
};

```

`year_month` represents a specific month of a specific year, but with an unspecified day. `year_month` is a field-based time point with a resolution of months. `year_month` meets the *Cpp17EqualityComparable* (Table 28) and *Cpp17LessThanComparable* (Table 29) requirements.

`year_month` is a trivially copyable and standard-layout class type.

### 29.8.13.2 Member functions

[time.cal.ym.members]

```
constexpr year_month(const chrono::year& y, const chrono::month& m) noexcept;
```

*Effects:* Initializes `y_` with `y`, and `m_` with `m`.

```
constexpr chrono::year year() const noexcept;
```

*Returns:* `y_`.

```
constexpr chrono::month month() const noexcept;
```

*Returns:* `m_`.

```
constexpr year_month& operator+=(const months& dm) noexcept;
```

*Constraints:* If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

*Effects:* `*this = *this + dm`.

*Returns:* `*this`.

```
constexpr year_month& operator-=(const months& dm) noexcept;
```

*Constraints:* If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

*Effects:* `*this = *this - dm`.

*Returns:* `*this`.

```
constexpr year_month& operator+=(const years& dy) noexcept;
```

*Effects:* `*this = *this + dy`.

*Returns:* `*this`.

```
constexpr year_month& operator-=(const years& dy) noexcept;
```

*Effects:* `*this = *this - dy`.

*Returns:* `*this`.

```
constexpr bool ok() const noexcept;
```

*Returns:* `y_.ok() && m_.ok()`.

### 29.8.13.3 Non-member functions

[time.cal.ym.nonmembers]

```
constexpr bool operator==(const year_month& x, const year_month& y) noexcept;
```

*Returns:* `x.year() == y.year() && x.month() == y.month()`.

```
constexpr strong_ordering operator<=>(const year_month& x, const year_month& y) noexcept;
```

*Effects:* Equivalent to:

```
if (auto c = x.year() <=> y.year(); c != 0) return c;
return x.month() <=> y.month();
```

```
constexpr year_month operator+(const year_month& ym, const months& dm) noexcept;
```

*Constraints:* If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

*Returns:* A `year_month` value `z` such that `z.ok() && z - ym == dm` is true.

*Complexity:*  $\mathcal{O}(1)$  with respect to the value of `dm`.

```
constexpr year_month operator+(const months& dm, const year_month& ym) noexcept;
```

*Constraints:* If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

*Returns:* `ym + dm`.

```
constexpr year_month operator-(const year_month& ym, const months& dm) noexcept;
```

*Constraints:* If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

*Returns:* `ym - dm`.

```
constexpr months operator-(const year_month& x, const year_month& y) noexcept;
```

*Returns:*

```
x.year() - y.year() + months{static_cast<int>(unsigned{x.month()}) -
static_cast<int>(unsigned{y.month()})}
```

```
constexpr year_month operator+(const year_month& ym, const years& dy) noexcept;
```

*Returns:* `(ym.year() + dy) / ym.month()`.

```
constexpr year_month operator+(const years& dy, const year_month& ym) noexcept;
```

*Returns:* `ym + dy`.

```
constexpr year_month operator-(const year_month& ym, const years& dy) noexcept;
```

*Returns:* `ym - dy`.

```
template<class charT, class traits>
```

```
basic_ostream<charT, traits>&
```

```
operator<<(basic_ostream<charT, traits>& os, const year_month& ym);
```

*Effects:* Equivalent to:

```
return os << format(os.getloc(), STatically-WIDEN<charT>("{}/{:L}"),
ym.year(), ym.month());
```

```
template<class charT, class traits, class Alloc = allocator<charT>>
```

```
basic_istream<charT, traits>&
```

```
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
year_month& ym, basic_string<charT, traits, Alloc>* abbrev = nullptr,
minutes* offset = nullptr);
```

*Effects:* Attempts to parse the input stream `is` into the `year_month` `ym` using the format flags given in the NTCTS `fmt` as specified in 29.13. If the parse fails to decode a valid `year_month`, `is.setstate(ios_base::failbit)` is called and `ym` is not modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null.

*Returns:* `is`.

**29.8.14 Class year\_month\_day****[time.cal.ymd]****29.8.14.1 Overview****[time.cal.ymd.overview]**

```

namespace std::chrono {
    class year_month_day {
        chrono::year y_;           // exposition only
        chrono::month m_;          // exposition only
        chrono::day d_;            // exposition only

    public:
        year_month_day() = default;
        constexpr year_month_day(const chrono::year& y, const chrono::month& m,
                                const chrono::day& d) noexcept;
        constexpr year_month_day(const year_month_day_last& ymdl) noexcept;
        constexpr year_month_day(const sys_days& dp) noexcept;
        constexpr explicit year_month_day(const local_days& dp) noexcept;

        constexpr year_month_day& operator+=(const months& m) noexcept;
        constexpr year_month_day& operator-=(const months& m) noexcept;
        constexpr year_month_day& operator+=(const years& y) noexcept;
        constexpr year_month_day& operator-=(const years& y) noexcept;

        constexpr chrono::year year() const noexcept;
        constexpr chrono::month month() const noexcept;
        constexpr chrono::day day() const noexcept;

        constexpr operator sys_days() const noexcept;
        constexpr explicit operator local_days() const noexcept;
        constexpr bool ok() const noexcept;
    };
}

```

`year_month_day` represents a specific year, month, and day. `year_month_day` is a field-based time point with a resolution of days.

NOTE `year_month_day` supports years- and months-oriented arithmetic, but not days-oriented arithmetic. For the latter, there is a conversion to `sys_days`, which efficiently supports days-oriented arithmetic.

`year_month_day` meets the *Cpp17EqualityComparable* (Table 28) and *Cpp17LessThanComparable* (Table 29) requirements.

`year_month_day` is a trivially copyable and standard-layout class type.

**29.8.14.2 Member functions****[time.cal.ymd.members]**

```
constexpr year_month_day(const chrono::year& y, const chrono::month& m,
                        const chrono::day& d) noexcept;
```

*Effects:* Initializes `y_` with `y`, `m_` with `m`, and `d_` with `d`.

```
constexpr year_month_day(const year_month_day_last& ymdl) noexcept;
```

*Effects:* Initializes `y_` with `ymdl.year()`, `m_` with `ymdl.month()`, and `d_` with `ymdl.day()`.

NOTE This conversion from `year_month_day_last` to `year_month_day` can be more efficient than converting a `year_month_day_last` to a `sys_days`, and then converting that `sys_days` to a `year_month_day`.

```
constexpr year_month_day(const sys_days& dp) noexcept;
```

*Effects:* Constructs an object of type `year_month_day` that corresponds to the date represented by `dp`.

*Remarks:* For any value `ymd` of type `year_month_day` for which `ymd.ok()` is true, `ymd == year_month_day{sys_days{ymd}}` is true.

```
constexpr explicit year_month_day(const local_days& dp) noexcept;
```

*Effects:* Equivalent to constructing with `sys_days{dp.time_since_epoch()}`.

```
constexpr year_month_day& operator+=(const months& m) noexcept;
```

*Constraints:* If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

*Effects:* `*this = *this + m`.

*Returns:* `*this`.

```
constexpr year_month_day& operator-=(const months& m) noexcept;
```

*Constraints:* If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

*Effects:* `*this = *this - m`.

*Returns:* `*this`.

```
constexpr year_month_day& year_month_day::operator+=(const years& y) noexcept;
```

*Effects:* `*this = *this + y`.

*Returns:* `*this`.

```
constexpr year_month_day& year_month_day::operator-=(const years& y) noexcept;
```

*Effects:* `*this = *this - y`.

*Returns:* `*this`.

```
constexpr chrono::year year() const noexcept;
```

*Returns:* `y_`.

```
constexpr chrono::month month() const noexcept;
```

*Returns:* `m_`.

```
constexpr chrono::day day() const noexcept;
```

*Returns:* `d_`.

```
constexpr operator sys_days() const noexcept;
```

*Returns:* If `ok()`, returns a `sys_days` holding a count of days from the `sys_days` epoch to `*this` (a negative value if `*this` represents a date prior to the `sys_days` epoch). Otherwise, if `y_.ok() && m_.ok()` is true, returns `sys_days{y_/m_/1d} + (d_ - 1d)`. Otherwise the value returned is unspecified.

*Remarks:* A `sys_days` in the range `[days{-12687428}, days{11248737}]` which is converted to a `year_month_day` has the same value when converted back to a `sys_days`.

EXAMPLE

```
static_assert(year_month_day{sys_days{2017y/January/0}} == 2016y/December/31);
static_assert(year_month_day{sys_days{2017y/January/31}} == 2017y/January/31);
static_assert(year_month_day{sys_days{2017y/January/32}} == 2017y/February/1);
```

```
constexpr explicit operator local_days() const noexcept;
```

*Returns:* `local_days{sys_days{*this}.time_since_epoch()}`.

```
constexpr bool ok() const noexcept;
```

*Returns:* If `y_.ok()` is true, and `m_.ok()` is true, and `d_` is in the range `[1d, (y_/m_/last).day()]`, then returns true; otherwise returns false.

### 29.8.14.3 Non-member functions

[time.cal.ymd.nonmembers]

```
constexpr bool operator==(const year_month_day& x, const year_month_day& y) noexcept;
```

*Returns:* `x.year() == y.year() && x.month() == y.month() && x.day() == y.day()`.

```
constexpr strong_ordering operator<=>(const year_month_day& x, const year_month_day& y) noexcept;
```

*Effects:* Equivalent to:

```

if (auto c = x.year() <=> y.year(); c != 0) return c;
if (auto c = x.month() <=> y.month(); c != 0) return c;
return x.day() <=> y.day();

```

```
constexpr year_month_day operator+(const year_month_day& ymd, const months& dm) noexcept;
```

*Constraints:* If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

*Returns:* `(ymd.year() / ymd.month() + dm) / ymd.day()`.

NOTE 1 If `ymd.day()` is in the range `[1d, 28d]`, `ok()` will return `true` for the resultant `year_month_day`.

```
constexpr year_month_day operator+(const months& dm, const year_month_day& ymd) noexcept;
```

*Constraints:* If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

*Returns:* `ymd + dm`.

```
constexpr year_month_day operator-(const year_month_day& ymd, const months& dm) noexcept;
```

*Constraints:* If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

*Returns:* `ymd + (-dm)`.

```
constexpr year_month_day operator+(const year_month_day& ymd, const years& dy) noexcept;
```

*Returns:* `(ymd.year() + dy) / ymd.month() / ymd.day()`.

NOTE 2 If `ymd.month()` is February and `ymd.day()` is not in the range `[1d, 28d]`, `ok()` can return `false` for the resultant `year_month_day`.

```
constexpr year_month_day operator+(const years& dy, const year_month_day& ymd) noexcept;
```

*Returns:* `ymd + dy`.

```
constexpr year_month_day operator-(const year_month_day& ymd, const years& dy) noexcept;
```

*Returns:* `ymd + (-dy)`.

```
template<class charT, class traits>
```

```
    basic_ostream<charT, traits>&
```

```
    operator<<(basic_ostream<charT, traits>& os, const year_month_day& ymd);
```

*Effects:* Equivalent to:

```

return os << (ymd.ok() ?
    format(STATICALLY_WIDEN<charT>("{:%F}"), ymd) :
    format(STATICALLY_WIDEN<charT>("{:%F} is not a valid date"), ymd));

```

```
template<class charT, class traits, class Alloc = allocator<charT>>
```

```
    basic_istream<charT, traits>&
```

```
    from_stream(basic_istream<charT, traits>& is, const charT* fmt,
        year_month_day& ymd, basic_string<charT, traits, Alloc>* abbrev = nullptr,
        minutes* offset = nullptr);
```

*Effects:* Attempts to parse the input stream `is` into the `year_month_day` `ymd` using the format flags given in the NTCTS `fmt` as specified in 29.13. If the parse fails to decode a valid `year_month_day`, `is.setstate(ios_base::failbit)` is called and `ymd` is not modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null.

*Returns:* `is`.

## 29.8.15 Class `year_month_day_last`

[time.cal.ymdlast]

### 29.8.15.1 Overview

[time.cal.ymdlast.overview]

```
namespace std::chrono {
```

```
    class year_month_day_last {
```

```
        chrono::year y_; // exposition only
```

```
        chrono::month_day_last mdl_; // exposition only
```

```

public:
    constexpr year_month_day_last(const chrono::year& y,
                                   const chrono::month_day_last& mdl) noexcept;

    constexpr year_month_day_last& operator+=(const months& m) noexcept;
    constexpr year_month_day_last& operator-=(const months& m) noexcept;
    constexpr year_month_day_last& operator+=(const years& y) noexcept;
    constexpr year_month_day_last& operator-=(const years& y) noexcept;

    constexpr chrono::year          year()          const noexcept;
    constexpr chrono::month         month()         const noexcept;
    constexpr chrono::month_day_last month_day_last() const noexcept;
    constexpr chrono::day           day()           const noexcept;

    constexpr          operator sys_days() const noexcept;
    constexpr explicit operator local_days() const noexcept;
    constexpr bool ok() const noexcept;
};
}

```

`year_month_day_last` represents the last day of a specific year and month. `year_month_day_last` is a field-based time point with a resolution of `days`, except that it is restricted to pointing to the last day of a year and month.

NOTE `year_month_day_last` supports `years`- and `months`-oriented arithmetic, but not `days`-oriented arithmetic. For the latter, there is a conversion to `sys_days`, which efficiently supports `days`-oriented arithmetic.

`year_month_day_last` meets the *Cpp17EqualityComparable* (Table 28) and *Cpp17LessThanComparable* (Table 29) requirements.

`year_month_day_last` is a trivially copyable and standard-layout class type.

#### 29.8.15.2 Member functions

[time.cal.ymdlast.members]

```

constexpr year_month_day_last(const chrono::year& y,
                               const chrono::month_day_last& mdl) noexcept;

```

*Effects:* Initializes `y_` with `y` and `mdl_` with `mdl`.

```

constexpr year_month_day_last& operator+=(const months& m) noexcept;

```

*Constraints:* If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

*Effects:* `*this = *this + m`.

*Returns:* `*this`.

```

constexpr year_month_day_last& operator-=(const months& m) noexcept;

```

*Constraints:* If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

*Effects:* `*this = *this - m`.

*Returns:* `*this`.

```

constexpr year_month_day_last& operator+=(const years& y) noexcept;

```

*Effects:* `*this = *this + y`.

*Returns:* `*this`.

```

constexpr year_month_day_last& operator-=(const years& y) noexcept;

```

*Effects:* `*this = *this - y`.

*Returns:* `*this`.

```

constexpr chrono::year year() const noexcept;

```

*Returns:* `y_`.

constexpr chrono::month month() const noexcept;

*Returns:* mdl\_.month().

constexpr chrono::month\_day\_last month\_day\_last() const noexcept;

*Returns:* mdl\_.

constexpr chrono::day day() const noexcept;

*Returns:* If ok() is true, returns a day representing the last day of the (year, month) pair represented by \*this. Otherwise, the returned value is unspecified.

NOTE This value can be computed on demand.

constexpr operator sys\_days() const noexcept;

*Returns:* sys\_days{year()/month()/day()}.

constexpr explicit operator local\_days() const noexcept;

*Returns:* local\_days{sys\_days{\*this}.time\_since\_epoch()}.

constexpr bool ok() const noexcept;

*Returns:* y\_.ok() && mdl\_.ok().

### 29.8.15.3 Non-member functions

[time.cal.ymdlast.nonmembers]

constexpr bool operator==(const year\_month\_day\_last& x, const year\_month\_day\_last& y) noexcept;

*Returns:* x.year() == y.year() && x.month\_day\_last() == y.month\_day\_last().

constexpr strong\_ordering operator<=>(const year\_month\_day\_last& x,  
const year\_month\_day\_last& y) noexcept;

*Effects:* Equivalent to:

```
if (auto c = x.year() <=> y.year(); c != 0) return c;
return x.month_day_last() <=> y.month_day_last();
```

constexpr year\_month\_day\_last

operator+(const year\_month\_day\_last& ymdl, const months& dm) noexcept;

*Constraints:* If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).

*Returns:* (ymdl.year() / ymdl.month() + dm) / last.

constexpr year\_month\_day\_last

operator+(const months& dm, const year\_month\_day\_last& ymdl) noexcept;

*Constraints:* If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).

*Returns:* ymdl + dm.

constexpr year\_month\_day\_last

operator-(const year\_month\_day\_last& ymdl, const months& dm) noexcept;

*Constraints:* If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).

*Returns:* ymdl + (-dm).

constexpr year\_month\_day\_last

operator+(const year\_month\_day\_last& ymdl, const years& dy) noexcept;

*Returns:* {ymdl.year()+dy, ymdl.month\_day\_last()}.

constexpr year\_month\_day\_last

operator+(const years& dy, const year\_month\_day\_last& ymdl) noexcept;

*Returns:* ymdl + dy.

```
constexpr year_month_day_last
operator-(const year_month_day_last& ymdl, const years& dy) noexcept;

Returns: ymdl + (-dy).

template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const year_month_day_last& ymdl);

Effects: Equivalent to:

return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{}/{:L}"),
ymdl.year(), ymdl.month_day_last());
```

## 29.8.16 Class year\_month\_weekday

[time.cal.ymwd]

### 29.8.16.1 Overview

[time.cal.ymwd.overview]

```
namespace std::chrono {
class year_month_weekday {
    chrono::year y_;           // exposition only
    chrono::month m_;          // exposition only
    chrono::weekday_indexed wdi_; // exposition only

public:
    year_month_weekday() = default;
    constexpr year_month_weekday(const chrono::year& y, const chrono::month& m,
                                const chrono::weekday_indexed& wdi) noexcept;
    constexpr year_month_weekday(const sys_days& dp) noexcept;
    constexpr explicit year_month_weekday(const local_days& dp) noexcept;

    constexpr year_month_weekday& operator+=(const months& m) noexcept;
    constexpr year_month_weekday& operator-=(const months& m) noexcept;
    constexpr year_month_weekday& operator+=(const years& y) noexcept;
    constexpr year_month_weekday& operator-=(const years& y) noexcept;

    constexpr chrono::year year() const noexcept;
    constexpr chrono::month month() const noexcept;
    constexpr chrono::weekday weekday() const noexcept;
    constexpr unsigned index() const noexcept;
    constexpr chrono::weekday_indexed weekday_indexed() const noexcept;

    constexpr operator sys_days() const noexcept;
    constexpr explicit operator local_days() const noexcept;
    constexpr bool ok() const noexcept;
};
}
```

`year_month_weekday` represents a specific year, month, and  $n^{\text{th}}$  weekday of the month. `year_month_weekday` is a field-based time point with a resolution of days.

NOTE `year_month_weekday` supports years- and months-oriented arithmetic, but not days-oriented arithmetic. For the latter, there is a conversion to `sys_days`, which efficiently supports days-oriented arithmetic.

`year_month_weekday` meets the *Cpp17EqualityComparable* (Table 28) requirements.

`year_month_weekday` is a trivially copyable and standard-layout class type.

### 29.8.16.2 Member functions

[time.cal.ymwd.members]

```
constexpr year_month_weekday(const chrono::year& y, const chrono::month& m,
                             const chrono::weekday_indexed& wdi) noexcept;

Effects: Initializes y_ with y, m_ with m, and wdi_ with wdi.

constexpr year_month_weekday(const sys_days& dp) noexcept;

Effects: Constructs an object of type year_month_weekday which corresponds to the date represented by dp.
```

*Remarks:* For any value `ymwd` of type `year_month_weekday` for which `ymwd.ok()` is `true`, `ymwd == year_month_weekday{sys_days{ymwd}}` is `true`.

```
constexpr explicit year_month_weekday(const local_days& dp) noexcept;
```

*Effects:* Equivalent to constructing with `sys_days{dp.time_since_epoch()}`.

```
constexpr year_month_weekday& operator+=(const months& m) noexcept;
```

*Constraints:* If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

*Effects:* `*this = *this + m`.

*Returns:* `*this`.

```
constexpr year_month_weekday& operator-=(const months& m) noexcept;
```

*Constraints:* If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

*Effects:* `*this = *this - m`.

*Returns:* `*this`.

```
constexpr year_month_weekday& operator+=(const years& y) noexcept;
```

*Effects:* `*this = *this + y`.

*Returns:* `*this`.

```
constexpr year_month_weekday& operator-=(const years& y) noexcept;
```

*Effects:* `*this = *this - y`.

*Returns:* `*this`.

```
constexpr chrono::year year() const noexcept;
```

*Returns:* `y_`.

```
constexpr chrono::month month() const noexcept;
```

*Returns:* `m_`.

```
constexpr chrono::weekday weekday() const noexcept;
```

*Returns:* `wdi_.weekday()`.

```
constexpr unsigned index() const noexcept;
```

*Returns:* `wdi_.index()`.

```
constexpr chrono::weekday_indexed weekday_indexed() const noexcept;
```

*Returns:* `wdi_`.

```
constexpr operator sys_days() const noexcept;
```

*Returns:* If `y_.ok() && m_.ok() && wdi_.weekday().ok()`, returns a `sys_days` that represents the date  $(\text{index}() - 1) * 7$  days after the first `weekday()` of `year()/month()`. If `index()` is 0 the returned `sys_days` represents the date 7 days prior to the first `weekday()` of `year()/month()`. Otherwise the returned value is unspecified.

```
constexpr explicit operator local_days() const noexcept;
```

*Returns:* `local_days{sys_days{*this}.time_since_epoch()}`.

```
constexpr bool ok() const noexcept;
```

*Returns:* If any of `y_.ok()`, `m_.ok()`, or `wdi_.ok()` is `false`, returns `false`. Otherwise, if `*this` represents a valid date, returns `true`. Otherwise, returns `false`.

**29.8.16.3 Non-member functions****[time.cal.ymwd.nonmembers]**

```
constexpr bool operator==(const year_month_weekday& x, const year_month_weekday& y) noexcept;
```

*Returns:*

```

```
operator+(const years& dy, const year_month_weekday_last& ymwdl) noexcept;
```

*Returns:* ymwdl + dy.

```
constexpr year_month_weekday_last
```

```
operator-(const year_month_weekday_last& ymwdl, const years& dy) noexcept;
```

*Returns:* ymwdl + (-dy).

```
template<class charT, class traits>
```

```
basic_ostream<charT, traits>&
```

```
operator<<(basic_ostream<charT, traits>& os, const year_month_weekday_last& ymwdl);
```

*Effects:* Equivalent to:

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{}/{:L}/{:L}"),  
                    ymwdl.year(), ymwdl.month(), ymwdl.weekday_last());
```

### 29.8.18 Conventional syntax operators

[time.cal.operators]

A set of overloaded **operator/** functions provides a conventional syntax for the creation of civil calendar dates.

NOTE 1 The year, month, and day are accepted in any of the following 3 orders:

```
year/month/day  
month/day/year  
day/month/year
```

Anywhere a *day* is needed, any of the following can also be specified:

```
last
weekday[i]
weekday[last]
```

NOTE 2 Partial-date types such as `year_month` and `month_day` can be created by not applying the second division operator for any of the three orders. For example:

```
year_month ym = 2015y/April;
month_day md1 = April/4;
month_day md2 = 4d/April;
```

EXAMPLE

```
auto a = 2015/4/4;           // a == int(125)
auto b = 2015y/4/4;          // b == year_month_day{year(2015), month(4), day(4)}
auto c = 2015y/4d/April;     // error: no viable operator/ for first /
auto d = 2015/April/4;       // error: no viable operator/ for first /
```

```
constexpr year_month
operator/(const year& y, const month& m) noexcept;
```

*Returns:* {y, m}.

```
constexpr year_month
operator/(const year& y, int m) noexcept;
```

*Returns:* y / month(m).

```
constexpr month_day
operator/(const month& m, const day& d) noexcept;
```

*Returns:* {m, d}.

```
constexpr month_day
operator/(const month& m, int d) noexcept;
```

*Returns:* m / day(d).

```
constexpr month_day
operator/(int m, const day& d) noexcept;
```

*Returns:* month(m) / d.

```
constexpr month_day
operator/(const day& d, const month& m) noexcept;
```

*Returns:* m / d.

```
constexpr month_day
operator/(const day& d, int m) noexcept;
```

*Returns:* month(m) / d.

```
constexpr month_day_last
operator/(const month& m, last_spec) noexcept;
```

*Returns:* month\_day\_last{m}.

```
constexpr month_day_last
operator/(int m, last_spec) noexcept;
```

*Returns:* month(m) / last.

```
constexpr month_day_last
operator/(last_spec, const month& m) noexcept;
```

*Returns:* m / last.

```
constexpr month_day_last
operator/(last_spec, int m) noexcept;
```

*Returns:* month(m) / last.

```
constexpr month_weekday
operator/(const month& m, const weekday_indexed& wdi) noexcept;
Returns: {m, wdi}.
```

```
constexpr month_weekday
operator/(int m, const weekday_indexed& wdi) noexcept;
Returns: month(m) / wdi.
```

```
constexpr month_weekday
operator/(const weekday_indexed& wdi, const month& m) noexcept;
Returns: m / wdi.
```

```
constexpr month_weekday
operator/(const weekday_indexed& wdi, int m) noexcept;
Returns: month(m) / wdi.
```

```
constexpr month_weekday_last
operator/(const month& m, const weekday_last& wdl) noexcept;
Returns: {m, wdl}.
```

```
constexpr month_weekday_last
operator/(int m, const weekday_last& wdl) noexcept;
Returns: month(m) / wdl.
```

```
constexpr month_weekday_last
operator/(const weekday_last& wdl, const month& m) noexcept;
Returns: m / wdl.
```

```
constexpr month_weekday_last
operator/(const weekday_last& wdl, int m) noexcept;
Returns: month(m) / wdl.
```

```
constexpr year_month_day
operator/(const year_month& ym, const day& d) noexcept;
Returns: {ym.year(), ym.month(), d}.
```

```
constexpr year_month_day
operator/(const year_month& ym, int d) noexcept;
Returns: ym / day(d).
```

```
constexpr year_month_day
operator/(const year& y, const month_day& md) noexcept;
Returns: y / md.month() / md.day().
```

```
constexpr year_month_day
operator/(int y, const month_day& md) noexcept;
Returns: year(y) / md.
```

```
constexpr year_month_day
operator/(const month_day& md, const year& y) noexcept;
Returns: y / md.
```

```
constexpr year_month_day
operator/(const month_day& md, int y) noexcept;
Returns: year(y) / md.
```

```
constexpr year_month_day_last
operator/(const year_month& ym, last_spec) noexcept;
Returns: {ym.year(), month_day_last{ym.month()} }.
```

constexpr year\_month\_day\_last  
operator/(const year& y, const month\_day\_last& mdl) noexcept;  
*Returns:* {y, mdl}.

constexpr year\_month\_day\_last  
operator/(int y, const month\_day\_last& mdl) noexcept;  
*Returns:* year(y) / mdl.

constexpr year\_month\_day\_last  
operator/(const month\_day\_last& mdl, const year& y) noexcept;  
*Returns:* y / mdl.

constexpr year\_month\_day\_last  
operator/(const month\_day\_last& mdl, int y) noexcept;  
*Returns:* year(y) / mdl.

constexpr year\_month\_weekday  
operator/(const year\_month& ym, const weekday\_indexed& wdi) noexcept;  
*Returns:* {ym.year(), ym.month(), wdi}.

constexpr year\_month\_weekday  
operator/(const year& y, const month\_weekday& mwd) noexcept;  
*Returns:* {y, mwd.month(), mwd.weekday\_indexed()}.

constexpr year\_month\_weekday  
operator/(int y, const month\_weekday& mwd) noexcept;  
*Returns:* year(y) / mwd.

constexpr year\_month\_weekday  
operator/(const month\_weekday& mwd, const year& y) noexcept;  
*Returns:* y / mwd.

constexpr year\_month\_weekday  
operator/(const month\_weekday& mwd, int y) noexcept;  
*Returns:* year(y) / mwd.

constexpr year\_month\_weekday\_last  
operator/(const year\_month& ym, const weekday\_last& wdl) noexcept;  
*Returns:* {ym.year(), ym.month(), wdl}.

constexpr year\_month\_weekday\_last  
operator/(const year& y, const month\_weekday\_last& mwdl) noexcept;  
*Returns:* {y, mwdl.month(), mwdl.weekday\_last()}.

constexpr year\_month\_weekday\_last  
operator/(int y, const month\_weekday\_last& mwdl) noexcept;  
*Returns:* year(y) / mwdl.

constexpr year\_month\_weekday\_last  
operator/(const month\_weekday\_last& mwdl, const year& y) noexcept;  
*Returns:* y / mwdl.

constexpr year\_month\_weekday\_last  
operator/(const month\_weekday\_last& mwdl, int y) noexcept;  
*Returns:* year(y) / mwdl.

## 29.9 Class template `hh_mm_ss`

[time.hms]

### 29.9.1 Overview

[time.hms.overview]

```

namespace std::chrono {
    template<class Duration> class hh_mm_ss {
    public:
        static constexpr unsigned fractional_width = see below;
        using precision = see below;

        constexpr hh_mm_ss() noexcept : hh_mm_ss{Duration::zero()} {}
        constexpr explicit hh_mm_ss(Duration d);

        constexpr bool is_negative() const noexcept;
        constexpr chrono::hours hours() const noexcept;
        constexpr chrono::minutes minutes() const noexcept;
        constexpr chrono::seconds seconds() const noexcept;
        constexpr precision subseconds() const noexcept;

        constexpr explicit operator precision() const noexcept;
        constexpr precision to_duration() const noexcept;

    private:
        bool is_neg; // exposition only
        chrono::hours h; // exposition only
        chrono::minutes m; // exposition only
        chrono::seconds s; // exposition only
        precision ss; // exposition only
    };
}

```

The `hh_mm_ss` class template splits a `duration` into a multi-field time structure *hours:minutes:seconds* and possibly *subseconds*, where *subseconds* will be a duration unit based on a non-positive power of 10. The `Duration` template parameter dictates the precision to which the time is split. A `hh_mm_ss` models negative durations with a distinct `is_negative` getter that returns `true` when the input duration is negative. The individual duration fields always return non-negative durations even when `is_negative()` indicates the structure is representing a negative duration.

If `Duration` is not a specialization of `duration`, the program is ill-formed.

### 29.9.2 Members

[time.hms.members]

```
static constexpr unsigned fractional_width = see below;
```

`fractional_width` is the number of fractional decimal digits represented by `precision`. `fractional_width` has the value of the smallest possible integer in the range  $[0, 18]$  such that `precision` will exactly represent all values of `Duration`. If no such value of `fractional_width` exists, then `fractional_width` is 6.

EXAMPLE See Table 100 for some durations, the resulting `fractional_width`, and the formatted fractional second output of `Duration{1}`.

Table 100 — Examples for `fractional_width` [tab:time.hms.width]

| Duration                                            | fractional_width | Formatted fractional second output |
|-----------------------------------------------------|------------------|------------------------------------|
| hours, minutes, and seconds                         | 0                |                                    |
| milliseconds                                        | 3                | 0.001                              |
| microseconds                                        | 6                | 0.000001                           |
| nanoseconds                                         | 9                | 0.000000001                        |
| <code>duration&lt;int, ratio&lt;1, 2&gt;&gt;</code> | 1                | 0.5                                |
| <code>duration&lt;int, ratio&lt;1, 3&gt;&gt;</code> | 6                | 0.333333                           |
| <code>duration&lt;int, ratio&lt;1, 4&gt;&gt;</code> | 2                | 0.25                               |
| <code>duration&lt;int, ratio&lt;1, 5&gt;&gt;</code> | 1                | 0.2                                |
| <code>duration&lt;int, ratio&lt;1, 6&gt;&gt;</code> | 6                | 0.166666                           |
| <code>duration&lt;int, ratio&lt;1, 7&gt;&gt;</code> | 6                | 0.142857                           |
| <code>duration&lt;int, ratio&lt;1, 8&gt;&gt;</code> | 3                | 0.125                              |

Table 100 — Examples for fractional\_width (continued)

| Duration                       | fractional_width | Formatted fractional second output |
|--------------------------------|------------------|------------------------------------|
| duration<int, ratio<1, 9>>     | 6                | 0.111111                           |
| duration<int, ratio<1, 10>>    | 1                | 0.1                                |
| duration<int, ratio<756, 625>> | 4                | 0.2096                             |

using precision = see below;

precision is

```
duration<common_type_t<Duration::rep, seconds::rep>, ratio<1, 10fractional_width>>
```

constexpr explicit hh\_mm\_ss(Duration d);

*Effects:* Constructs an object of type hh\_mm\_ss which represents the Duration d with precision precision.

- Initializes is\_neg with d < Duration::zero().
- Initializes h with duration\_cast<chrono::hours>(abs(d)).
- Initializes m with duration\_cast<chrono::minutes>(abs(d) - hours()).
- Initializes s with duration\_cast<chrono::seconds>(abs(d) - hours() - minutes()).
- If treat\_as\_floating\_point\_v<precision::rep> is true, initializes ss with abs(d) - hours() - minutes() - seconds(). Otherwise, initializes ss with duration\_cast<precision>(abs(d) - hours() - minutes() - seconds()).

NOTE When precision::rep is integral and precision::period is ratio<1>, subseconds() always returns a value equal to 0s.

*Postconditions:* If treat\_as\_floating\_point\_v<precision::rep> is true, to\_duration() returns d, otherwise to\_duration() returns duration\_cast<precision>(d).

constexpr bool is\_negative() const noexcept;

*Returns:* is\_neg.

constexpr chrono::hours hours() const noexcept;

*Returns:* h.

constexpr chrono::minutes minutes() const noexcept;

*Returns:* m.

constexpr chrono::seconds seconds() const noexcept;

*Returns:* s.

constexpr precision subseconds() const noexcept;

*Returns:* ss.

constexpr precision to\_duration() const noexcept;

*Returns:* If is\_neg, returns -(h + m + s + ss), otherwise returns h + m + s + ss.

constexpr explicit operator precision() const noexcept;

*Returns:* to\_duration().

### 29.9.3 Non-members

[time.hms.nonmembers]

```
template<class charT, class traits, class Duration>
```

```
basic_ostream<charT, traits>&
```

```
operator<<((basic_ostream<charT, traits>& os, const hh_mm_ss<Duration>& hms);
```

*Effects:* Equivalent to:

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L%T}"), hms);
```

## EXAMPLE

```
for (auto ms : {-4083007ms, 4083007ms, 65745123ms}) {
    hh_mm_ss hms{ms};
    cout << hms << '\n';
}
cout << hh_mm_ss{65745s} << '\n';
```

Produces the output (assuming the "C" locale):

```
-01:08:03.007
01:08:03.007
18:15:45.123
18:15:45
```

**29.10 12/24 hours functions****[time.12]**

These functions aid in translating between a 12h format time of day and a 24h format time of day.

```
constexpr bool is_am(const hours& h) noexcept;
```

*Returns:* 0h <= h && h <= 11h.

```
constexpr bool is_pm(const hours& h) noexcept;
```

*Returns:* 12h <= h && h <= 23h.

```
constexpr hours make12(const hours& h) noexcept;
```

*Returns:* The 12-hour equivalent of *h* in the range [1h, 12h]. If *h* is not in the range [0h, 23h], the value returned is unspecified.

```
constexpr hours make24(const hours& h, bool is_pm) noexcept;
```

*Returns:* If *is\_pm* is false, returns the 24-hour equivalent of *h* in the range [0h, 11h], assuming *h* represents an ante meridiem hour. Otherwise, returns the 24-hour equivalent of *h* in the range [12h, 23h], assuming *h* represents a post meridiem hour. If *h* is not in the range [1h, 12h], the value returned is unspecified.

**29.11 Time zones****[time.zone]****29.11.1 General****[time.zone.general]**

[29.11](#) describes an interface for accessing the IANA Time Zone Database<sup>[10]</sup> that interoperates with `sys_time` and `local_time`. This interface provides time zone support to both the civil calendar types ([29.8](#)) and to user-defined calendars.

**29.11.2 Time zone database****[time.zone.db]****29.11.2.1 Class tzdb****[time.zone.db.tzdb]**

```
namespace std::chrono {
    struct tzdb {
        string          version;
        vector<time_zone> zones;
        vector<time_zone_link> links;
        vector<leap_second> leap_seconds;

        const time_zone* locate_zone(string_view tz_name) const;
        const time_zone* current_zone() const;
    };
}
```

Each vector in a `tzdb` object is sorted to enable fast lookup.

```
const time_zone* locate_zone(string_view tz_name) const;
```

*Returns:*

- If `zones` contains an element `tz` for which `tz.name() == tz_name`, a pointer to `tz`;
- otherwise, if `links` contains an element `tz_l` for which `tz_l.name() == tz_name`, then a pointer to the element `tz` of `zones` for which `tz.name() == tz_l.target()`.

NOTE 1 A `time_zone_link` specifies an alternative name for a `time_zone`.

*Throws:* If a `const time_zone*` cannot be found as described in the *Returns:* element, throws a `runtime_error`.

NOTE 2 On non-exceptional return, the return value is always a pointer to a valid `time_zone`.

```
const time_zone* current_zone() const;
```

*Returns:* A pointer to the time zone which the computer has set as its local time zone.

### 29.11.2.2 Class `tzdb_list`

[`time.zone.db.list`]

```
namespace std::chrono {
    class tzdb_list {
    public:
        tzdb_list(const tzdb_list&) = delete;
        tzdb_list& operator=(const tzdb_list&) = delete;

        // unspecified additional constructors

        class const_iterator;

        const tzdb& front() const noexcept;

        const_iterator erase_after(const_iterator p);

        const_iterator begin() const noexcept;
        const_iterator end() const noexcept;

        const_iterator cbegin() const noexcept;
        const_iterator cend() const noexcept;
    };
}
```

The `tzdb_list` database is a singleton; the unique object of type `tzdb_list` can be accessed via the `get_tzdb_list()` function.

NOTE 1 This access is only needed for those applications that need to have long uptimes and have a need to update the time zone database while running. Other applications can implicitly access the `front()` of this list via the read-only namespace scope functions `get_tzdb()`, `locate_zone()`, and `current_zone()`.

The `tzdb_list` object contains a list of `tzdb` objects.

`tzdb_list::const_iterator` is a constant iterator which meets the *Cpp17ForwardIterator* requirements and has a value type of `tzdb`.

```
const tzdb& front() const noexcept;
```

*Synchronization:* This operation is thread-safe with respect to `reload_tzdb()`.

NOTE 2 `reload_tzdb()` pushes a new `tzdb` onto the front of this container.

*Returns:* A reference to the first `tzdb` in the container.

```
const_iterator erase_after(const_iterator p);
```

*Preconditions:* The iterator following `p` is dereferenceable.

*Effects:* Erases the `tzdb` referred to by the iterator following `p`.

*Postconditions:* No pointers, references, or iterators are invalidated except those referring to the erased `tzdb`.

NOTE 3 It is not possible to erase the `tzdb` referred to by `begin()`.

*Returns:* An iterator pointing to the element following the one that was erased, or `end()` if no such element exists.

*Throws:* Nothing.

```
const_iterator begin() const noexcept;
```

*Returns:* An iterator referring to the first `tzdb` in the container.

```
const_iterator end() const noexcept;
```

*Returns:* An iterator referring to the position one past the last `tzdb` in the container.

```
const_iterator cbegin() const noexcept;
```

*Returns:* `begin()`.

```
const_iterator cend() const noexcept;
```

*Returns:* `end()`.

### 29.11.2.3 Time zone database access

[time.zone.db.access]

```
tzdb_list& get_tzdb_list();
```

*Effects:* If this is the first access to the time zone database, initializes the database. If this call initializes the database, the resulting database will be a `tzdb_list` holding a single initialized `tzdb`.

*Synchronization:* It is safe to call this function from multiple threads at one time.

*Returns:* A reference to the database.

*Throws:* `runtime_error` if for any reason a reference cannot be returned to a valid `tzdb_list` containing one or more valid `tzdb`s.

```
const tzdb& get_tzdb();
```

*Returns:* `get_tzdb_list().front()`.

```
const time_zone* locate_zone(string_view tz_name);
```

*Returns:* `get_tzdb().locate_zone(tz_name)`.

NOTE The time zone database will be initialized if this is the first reference to the database.

```
const time_zone* current_zone();
```

*Returns:* `get_tzdb().current_zone()`.

### 29.11.2.4 Remote time zone database support

[time.zone.db.remote]

The local time zone database is that supplied by the implementation when the program first accesses the database, for example via `current_zone()`. While the program is running, the implementation may choose to update the time zone database. This update shall not impact the program in any way unless the program calls the functions in this subclause. This potentially updated time zone database is referred to as the *remote time zone database*.

```
const tzdb& reload_tzdb();
```

*Effects:* This function first checks the version of the remote time zone database. If the versions of the local and remote databases are the same, there are no effects. Otherwise the remote database is pushed to the front of the `tzdb_list` accessed by `get_tzdb_list()`.

*Synchronization:* This function is thread-safe with respect to `get_tzdb_list().front()` and `get_tzdb_list().erase_after()`.

*Postconditions:* No pointers, references, or iterators are invalidated.

*Returns:* `get_tzdb_list().front()`.

*Throws:* `runtime_error` if for any reason a reference cannot be returned to a valid `tzdb`.

```
string remote_version();
```

*Returns:* The latest remote database version.

NOTE This can be compared with `get_tzdb().version` to discover if the local and remote databases are equivalent.

**29.11.3 Exception classes****[time.zone.exception]****29.11.3.1 Class nonexistent\_local\_time****[time.zone.exception.nonexist]**

```

namespace std::chrono {
    class nonexistent_local_time : public runtime_error {
    public:
        template<class Duration>
            nonexistent_local_time(const local_time<Duration>& tp, const local_info& i);
    };
}

```

`nonexistent_local_time` is thrown when an attempt is made to convert a non-existent `local_time` to a `sys_time` without specifying `choose::earliest` or `choose::latest`.

```

template<class Duration>
nonexistent_local_time(const local_time<Duration>& tp, const local_info& i);

```

*Preconditions:* `i.result == local_info::nonexistent` is true.

*Effects:* Initializes the base class with a sequence of `char` equivalent to that produced by `os.str()` initialized as shown below:

```

ostreamstream os;
os << tp << " is in a gap between\n"
    << local_seconds{i.first.end.time_since_epoch()} + i.first.offset << ' '
    << i.first.abbrev << " and\n"
    << local_seconds{i.second.begin.time_since_epoch()} + i.second.offset << ' '
    << i.second.abbrev
    << " which are both equivalent to\n"
    << i.first.end << " UTC";

```

EXAMPLE

```

#include <chrono>
#include <iostream>

int main() {
    using namespace std::chrono;
    try {
        auto zt = zoned_time{"America/New_York",
                             local_days{Sunday[2]/March/2016} + 2h + 30min};
    } catch (const nonexistent_local_time& e) {
        std::cout << e.what() << '\n';
    }
}

```

Produces the output:

```

2016-03-13 02:30:00 is in a gap between
2016-03-13 02:00:00 EST and
2016-03-13 03:00:00 EDT which are both equivalent to
2016-03-13 07:00:00 UTC

```

**29.11.3.2 Class ambiguous\_local\_time****[time.zone.exception.ambig]**

```

namespace std::chrono {
    class ambiguous_local_time : public runtime_error {
    public:
        template<class Duration>
            ambiguous_local_time(const local_time<Duration>& tp, const local_info& i);
    };
}

```

`ambiguous_local_time` is thrown when an attempt is made to convert an ambiguous `local_time` to a `sys_time` without specifying `choose::earliest` or `choose::latest`.

```

template<class Duration>
ambiguous_local_time(const local_time<Duration>& tp, const local_info& i);

```

*Preconditions:* `i.result == local_info::ambiguous` is true.

*Effects:* Initializes the base class with a sequence of `char` equivalent to that produced by `os.str()` initialized as shown below:

```
ostreamstream os;
os << tp << " is ambiguous. It could be\n"
  << tp << ' ' << i.first.abbrev << " == "
  << tp - i.first.offset << " UTC or\n"
  << tp << ' ' << i.second.abbrev << " == "
  << tp - i.second.offset << " UTC";
```

EXAMPLE

```
#include <chrono>
#include <iostream>

int main() {
    using namespace std::chrono;
    try {
        auto zt = zoned_time{"America/New_York",
                             local_days{Sunday[1]/November/2016} + 1h + 30min};
    } catch (const ambiguous_local_time& e) {
        std::cout << e.what() << '\n';
    }
}
```

Produces the output:

```
2016-11-06 01:30:00 is ambiguous. It could be
2016-11-06 01:30:00 EDT == 2016-11-06 05:30:00 UTC or
2016-11-06 01:30:00 EST == 2016-11-06 06:30:00 UTC
```

#### 29.11.4 Information classes

[time.zone.info]

##### 29.11.4.1 Class `sys_info`

[time.zone.info.sys]

```
namespace std::chrono {
    struct sys_info {
        sys_seconds    begin;
        sys_seconds    end;
        seconds        offset;
        minutes        save;
        string          abbrev;
    };
}
```

A `sys_info` object can be obtained from the combination of a `time_zone` and either a `sys_time` or `local_time`. It can also be obtained from a `zoned_time`, which is effectively a pair of a `time_zone` and `sys_time`.

NOTE This type provides a low-level interface to time zone information. Typical conversions from `sys_time` to `local_time` will use this class implicitly, not explicitly.

The `begin` and `end` data members indicate that, for the associated `time_zone` and `time_point`, the `offset` and `abbrev` are in effect in the range `[begin,end)`. This information can be used to efficiently iterate the transitions of a `time_zone`.

The `offset` data member indicates the UTC offset in effect for the associated `time_zone` and `time_point`. The relationship between `local_time` and `sys_time` is:

$$\text{offset} = \text{local\_time} - \text{sys\_time}$$

The `save` data member is extra information not normally needed for conversion between `local_time` and `sys_time`. If `save != 0min`, this `sys_info` is said to be on “daylight saving” time, and `offset - save` provides a non-authoritative suggestion of the offset this `time_zone` would use if it were off daylight saving time. A correct offset for the `time_zone` off daylight saving time can be obtained by querying the `time_zone` with a `time_point` that returns a `sys_info` where `save == 0min`. There is no guarantee what `time_point` (if any) returns such a `sys_info` except that it is guaranteed not to be in the range `[begin,end)` (if `save != 0min` for this `sys_info`).

The `abbrev` data member indicates the current abbreviation used for the associated `time_zone` and `time_point`. Abbreviations are not unique among the `time_zones`, and so one cannot reliably map abbreviations back to a `time_zone` and UTC offset.

```
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const sys_info& r);
```

*Effects:* Streams out the `sys_info` object `r` in an unspecified format.

*Returns:* `os`.

#### 29.11.4.2 Class `local_info`

[time.zone.info.local]

```
namespace std::chrono {
struct local_info {
    static constexpr int unique      = 0;
    static constexpr int nonexistent = 1;
    static constexpr int ambiguous   = 2;

    int result;
    sys_info first;
    sys_info second;
};
}
```

NOTE This type provides a low-level interface to time zone information. Typical conversions from `local_time` to `sys_time` will use this class implicitly, not explicitly.

Describes the result of converting a `local_time` to a `sys_time` as follows:

- When a `local_time` to `sys_time` conversion is unique, `result == unique`, `first` will be filled out with the correct `sys_info`, and `second` will be zero-initialized.
- If the conversion stems from a nonexistent `local_time` then `result == nonexistent`, `first` will be filled out with the `sys_info` that ends just prior to the `local_time`, and `second` will be filled out with the `sys_info` that begins just after the `local_time`.
- If the conversion stems from an ambiguous `local_time`, then `result == ambiguous`, `first` will be filled out with the `sys_info` that ends just after the `local_time`, and `second` will be filled out with the `sys_info` that starts just before the `local_time`.

```
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const local_info& r);
```

*Effects:* Streams out the `local_info` object `r` in an unspecified format.

*Returns:* `os`.

#### 29.11.5 Class `time_zone`

[time.zone.timezone]

##### 29.11.5.1 Overview

[time.zone.overview]

```
namespace std::chrono {
class time_zone {
public:
    time_zone(time_zone&&) = default;
    time_zone& operator=(time_zone&&) = default;

    // unspecified additional constructors

    string_view name() const noexcept;

    template<class Duration> sys_info get_info(const sys_time<Duration>& st) const;
    template<class Duration> local_info get_info(const local_time<Duration>& tp) const;

    template<class Duration>
        sys_time<common_type_t<Duration, seconds>>
        to_sys(const local_time<Duration>& tp) const;

    template<class Duration>
        sys_time<common_type_t<Duration, seconds>>
        to_sys(const local_time<Duration>& tp, choose z) const;
};
}
```

```

    template<class Duration>
        local_time<common_type_t<Duration, seconds>>
            to_local(const sys_time<Duration>& tp) const;
};
}

```

A `time_zone` represents all time zone transitions for a specific geographic area. `time_zone` construction is unspecified, and performed as part of database initialization.

NOTE `const time_zone` objects can be accessed via functions such as `locate_zone`.

### 29.11.5.2 Member functions

[time.zone.members]

```
string_view name() const noexcept;
```

*Returns:* The name of the `time_zone`.

EXAMPLE "America/New\_York".

```

template<class Duration>
    sys_info get_info(const sys_time<Duration>& st) const;

```

*Returns:* A `sys_info` `i` for which `st` is in the range `[i.begin, i.end)`.

```

template<class Duration>
    local_info get_info(const local_time<Duration>& tp) const;

```

*Returns:* A `local_info` for `tp`.

```

template<class Duration>
    sys_time<common_type_t<Duration, seconds>>
        to_sys(const local_time<Duration>& tp) const;

```

*Returns:* A `sys_time` that is at least as fine as `seconds`, and will be finer if the argument `tp` has finer precision. This `sys_time` is the UTC equivalent of `tp` according to the rules of this `time_zone`.

*Throws:* If the conversion from `tp` to a `sys_time` is ambiguous, throws `ambiguous_local_time`. If the `tp` represents a non-existent time between two UTC `time_points`, throws `nonexistent_local_time`.

```

template<class Duration>
    sys_time<common_type_t<Duration, seconds>>
        to_sys(const local_time<Duration>& tp, choose z) const;

```

*Returns:* A `sys_time` that is at least as fine as `seconds`, and will be finer if the argument `tp` has finer precision. This `sys_time` is the UTC equivalent of `tp` according to the rules of this `time_zone`. If the conversion from `tp` to a `sys_time` is ambiguous, returns the earlier `sys_time` if `z == choose::earliest`, and returns the later `sys_time` if `z == choose::latest`. If the `tp` represents a non-existent time between two UTC `time_points`, then the two UTC `time_points` will be the same, and that UTC `time_point` will be returned.

```

template<class Duration>
    local_time<common_type_t<Duration, seconds>>
        to_local(const sys_time<Duration>& tp) const;

```

*Returns:* The `local_time` associated with `tp` and this `time_zone`.

### 29.11.5.3 Non-member functions

[time.zone.nonmembers]

```
bool operator==(const time_zone& x, const time_zone& y) noexcept;
```

*Returns:* `x.name() == y.name()`.

```
strong_ordering operator<=>(const time_zone& x, const time_zone& y) noexcept;
```

*Returns:* `x.name() <=> y.name()`.

### 29.11.6 Class template `zoned_traits`

[time.zone.zonedtraits]

```

namespace std::chrono {
    template<class T> struct zoned_traits {};
}

```

`zoned_traits` provides a means for customizing the behavior of `zoned_time<Duration, TimeZonePtr>` for the `zoned_time` default constructor, and constructors taking `string_view`. A specialization for `const time_zone*` is provided by the implementation:

```
namespace std::chrono {
    template<> struct zoned_traits<const time_zone*> {
        static const time_zone* default_zone();
        static const time_zone* locate_zone(string_view name);
    };
}
```

```
static const time_zone* default_zone();
```

*Returns:* `std::chrono::locate_zone("UTC")`.

```
static const time_zone* locate_zone(string_view name);
```

*Returns:* `std::chrono::locate_zone(name)`.

## 29.11.7 Class template `zoned_time`

[time.zone.zonedtime]

### 29.11.7.1 Overview

[time.zone.zonedtime.overview]

```
namespace std::chrono {
    template<class Duration, class TimeZonePtr = const time_zone*>
    class zoned_time {
    public:
        using duration = common_type_t<Duration, seconds>;

    private:
        TimeZonePtr zone_; // exposition only
        sys_time<duration> tp_; // exposition only

        using traits = zoned_traits<TimeZonePtr>; // exposition only

    public:
        zoned_time();
        zoned_time(const zoned_time&) = default;
        zoned_time& operator=(const zoned_time&) = default;

        zoned_time(const sys_time<Duration>& st);
        explicit zoned_time(TimeZonePtr z);
        explicit zoned_time(string_view name);

        template<class Duration2>
            zoned_time(const zoned_time<Duration2, TimeZonePtr>& y);

        zoned_time(TimeZonePtr z, const sys_time<Duration>& st);
        zoned_time(string_view name, const sys_time<Duration>& st);

        zoned_time(TimeZonePtr z, const local_time<Duration>& tp);
        zoned_time(string_view name, const local_time<Duration>& tp);
        zoned_time(TimeZonePtr z, const local_time<Duration>& tp, choose c);
        zoned_time(string_view name, const local_time<Duration>& tp, choose c);

        template<class Duration2, class TimeZonePtr2>
            zoned_time(TimeZonePtr z, const zoned_time<Duration2, TimeZonePtr2>& y);
        template<class Duration2, class TimeZonePtr2>
            zoned_time(TimeZonePtr z, const zoned_time<Duration2, TimeZonePtr2>& y, choose);

        template<class Duration2, class TimeZonePtr2>
            zoned_time(string_view name, const zoned_time<Duration2, TimeZonePtr2>& y);
        template<class Duration2, class TimeZonePtr2>
            zoned_time(string_view name, const zoned_time<Duration2, TimeZonePtr2>& y, choose c);

        zoned_time& operator=(const sys_time<Duration>& st);
        zoned_time& operator=(const local_time<Duration>& lt);
    };
}
```

```

operator sys_time<duration>() const;
explicit operator local_time<duration>() const;

TimeZonePtr      get_time_zone() const;
local_time<duration> get_local_time() const;
sys_time<duration>  get_sys_time() const;
sys_info         get_info() const;
};

zoned_time() -> zoned_time<seconds>;

template<class Duration>
zoned_time(sys_time<Duration>)
    -> zoned_time<common_type_t<Duration, seconds>>;

template<class TimeZonePtrOrName>
using time-zone-representation = // exposition only
    conditional_t<is_convertible_v<TimeZonePtrOrName, string_view>,
        const time_zone*,
        remove_cvref_t<TimeZonePtrOrName>>;

template<class TimeZonePtrOrName>
zoned_time(TimeZonePtrOrName&&)
    -> zoned_time<seconds, time-zone-representation<TimeZonePtrOrName>>;

template<class TimeZonePtrOrName, class Duration>
zoned_time(TimeZonePtrOrName&&, sys_time<Duration>)
    -> zoned_time<common_type_t<Duration, seconds>,
        time-zone-representation<TimeZonePtrOrName>>;

template<class TimeZonePtrOrName, class Duration>
zoned_time(TimeZonePtrOrName&&, local_time<Duration>,
    choose = choose::earliest)
    -> zoned_time<common_type_t<Duration, seconds>,
        time-zone-representation<TimeZonePtrOrName>>;

template<class Duration, class TimeZonePtrOrName, class TimeZonePtr2>
zoned_time(TimeZonePtrOrName&&, zoned_time<Duration, TimeZonePtr2>,
    choose = choose::earliest)
    -> zoned_time<common_type_t<Duration, seconds>,
        time-zone-representation<TimeZonePtrOrName>>;
}

```

`zoned_time` represents a logical pairing of a `time_zone` and a `time_point` with precision `Duration`. `zoned_time<Duration>` maintains the invariant that it always refers to a valid time zone and represents a point in time that exists and is not ambiguous in that time zone.

If `Duration` is not a specialization of `chrono::duration`, the program is ill-formed.

Every constructor of `zoned_time` that accepts a `string_view` as its first parameter does not participate in class template argument deduction (12.2.2.9).

### 29.11.7.2 Constructors

[time.zone.zonedtime.ctor]

```
zoned_time();
```

*Constraints:* `traits::default_zone()` is a well-formed expression.

*Effects:* Initializes `zone_` with `traits::default_zone()` and default constructs `tp_`.

```
zoned_time(const sys_time<Duration>& st);
```

*Constraints:* `traits::default_zone()` is a well-formed expression.

*Effects:* Initializes `zone_` with `traits::default_zone()` and `tp_` with `st`.

```
explicit zoned_time(TimeZonePtr z);
```

*Preconditions:* `z` refers to a time zone.

*Effects:* Initializes `zone_` with `std::move(z)` and default constructs `tp_`.

```
explicit zoned_time(string_view name);
```

*Constraints:* `traits::locate_zone(string_view{})` is a well-formed expression and `zoned_time` is constructible from the return type of `traits::locate_zone(string_view{})`.

*Effects:* Initializes `zone_` with `traits::locate_zone(name)` and default constructs `tp_`.

```
template<class Duration2>
```

```
zoned_time(const zoned_time<Duration2, TimeZonePtr>& y);
```

*Constraints:* `is_convertible_v<sys_time<Duration2>, sys_time<Duration>>` is true.

*Effects:* Initializes `zone_` with `y.zone_` and `tp_` with `y.tp_`.

```
zoned_time(TimeZonePtr z, const sys_time<Duration>& st);
```

*Preconditions:* `z` refers to a time zone.

*Effects:* Initializes `zone_` with `std::move(z)` and `tp_` with `st`.

```
zoned_time(string_view name, const sys_time<Duration>& st);
```

*Constraints:* `zoned_time` is constructible from the return type of `traits::locate_zone(name)` and `st`.

*Effects:* Equivalent to construction with `{traits::locate_zone(name), st}`.

```
zoned_time(TimeZonePtr z, const local_time<Duration>& tp);
```

*Constraints:*

```
is_convertible_v<
    decltype(declval<TimeZonePtr>()->to_sys(local_time<Duration>{})),
    sys_time<duration>>
```

is true.

*Preconditions:* `z` refers to a time zone.

*Effects:* Initializes `zone_` with `std::move(z)` and `tp_` with `zone_->to_sys(tp)`.

```
zoned_time(string_view name, const local_time<Duration>& tp);
```

*Constraints:* `zoned_time` is constructible from the return type of `traits::locate_zone(name)` and `tp`.

*Effects:* Equivalent to construction with `{traits::locate_zone(name), tp}`.

```
zoned_time(TimeZonePtr z, const local_time<Duration>& tp, choose c);
```

*Constraints:*

```
is_convertible_v<
    decltype(declval<TimeZonePtr>()->to_sys(local_time<Duration>{}, choose::earliest)),
    sys_time<duration>>
```

is true.

*Preconditions:* `z` refers to a time zone.

*Effects:* Initializes `zone_` with `std::move(z)` and `tp_` with `zone_->to_sys(tp, c)`.

```
zoned_time(string_view name, const local_time<Duration>& tp, choose c);
```

*Constraints:* `zoned_time` is constructible from the return type of `traits::locate_zone(name)`, `local_time<Duration>`, and `choose`.

*Effects:* Equivalent to construction with `{traits::locate_zone(name), tp, c}`.

```
template<class Duration2, class TimeZonePtr2>
```

```
zoned_time(TimeZonePtr z, const zoned_time<Duration2, TimeZonePtr2>& y);
```

*Constraints:* `is_convertible_v<sys_time<Duration2>, sys_time<Duration>>` is true.

*Preconditions:* `z` refers to a valid time zone.

*Effects:* Initializes `zone_` with `std::move(z)` and `tp_` with `y.tp_`.

```
template<class Duration2, class TimeZonePtr2>
```

```
zoned_time(TimeZonePtr z, const zoned_time<Duration2, TimeZonePtr2>& y, choose);
```

*Constraints:* `is_convertible_v<sys_time<Duration2>, sys_time<Duration>>` is true.

*Preconditions:* `z` refers to a valid time zone.

*Effects:* Equivalent to construction with `{z, y}`.

NOTE 1 The `choose` parameter has no effect.

```
template<class Duration2, class TimeZonePtr2>
```

```
zoned_time(string_view name, const zoned_time<Duration2, TimeZonePtr2>& y);
```

*Constraints:* `zoned_time` is constructible from the return type of `traits::locate_zone(name)` and the type `zoned_time<Duration2, TimeZonePtr2>`.

*Effects:* Equivalent to construction with `{traits::locate_zone(name), y}`.

```
template<class Duration2, class TimeZonePtr2>
```

```
zoned_time(string_view name, const zoned_time<Duration2, TimeZonePtr2>& y, choose c);
```

*Constraints:* `zoned_time` is constructible from the return type of `traits::locate_zone(name)`, the type `zoned_time<Duration2, TimeZonePtr2>`, and the type `choose`.

*Effects:* Equivalent to construction with `{traits::locate_zone(name), y, c}`.

NOTE 2 The `choose` parameter has no effect.

### 29.11.7.3 Member functions

[`time.zone.zonedtime.members`]

```
zoned_time& operator=(const sys_time<Duration>& st);
```

*Effects:* After assignment, `get_sys_time() == st`. This assignment has no effect on the return value of `get_time_zone()`.

*Returns:* `*this`.

```
zoned_time& operator=(const local_time<Duration>& lt);
```

*Effects:* After assignment, `get_local_time() == lt`. This assignment has no effect on the return value of `get_time_zone()`.

*Returns:* `*this`.

```
operator sys_time<duration>() const;
```

*Returns:* `get_sys_time()`.

```
explicit operator local_time<duration>() const;
```

*Returns:* `get_local_time()`.

```
TimeZonePtr get_time_zone() const;
```

*Returns:* `zone_`.

```
local_time<duration> get_local_time() const;
```

*Returns:* `zone_->to_local(tp_)`.

```
sys_time<duration> get_sys_time() const;
```

*Returns:* `tp_`.

```
sys_info get_info() const;
```

*Returns:* `zone_->get_info(tp_)`.

**29.11.7.4 Non-member functions****[time.zone.zonedtime.nonmembers]**

```
template<class Duration1, class Duration2, class TimeZonePtr>
bool operator==(const zoned_time<Duration1, TimeZonePtr>& x,
               const zoned_time<Duration2, TimeZonePtr>& y);
```

*Returns:* `x.zone_ == y.zone_ && x.tp_ == y.tp_`.

```
template<class charT, class traits, class Duration, class TimeZonePtr>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os,
          const zoned_time<Duration, TimeZonePtr>& t);
```

*Effects:* Equivalent to:

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L%F %T %Z}"), t);
```

**29.11.8 Class leap\_second****[time.zone.leap]****29.11.8.1 Overview****[time.zone.leap.overview]**

```
namespace std::chrono {
class leap_second {
public:
    leap_second(const leap_second&) = default;
    leap_second& operator=(const leap_second&) = default;

    // unspecified additional constructors

    constexpr sys_seconds date() const noexcept;
    constexpr seconds value() const noexcept;
};
}
```

Objects of type `leap_second` representing the date and value of the leap second insertions are constructed and stored in the time zone database when initialized.

EXAMPLE

```
for (auto& l : get_tzdb().leap_seconds)
    if (l <= 2018y/March/17d)
        cout << l.date() << ": " << l.value() << '\n';
```

Produces the output:

```
1972-07-01 00:00:00: 1s
1973-01-01 00:00:00: 1s
1974-01-01 00:00:00: 1s
1975-01-01 00:00:00: 1s
1976-01-01 00:00:00: 1s
1977-01-01 00:00:00: 1s
1978-01-01 00:00:00: 1s
1979-01-01 00:00:00: 1s
1980-01-01 00:00:00: 1s
1981-07-01 00:00:00: 1s
1982-07-01 00:00:00: 1s
1983-07-01 00:00:00: 1s
1985-07-01 00:00:00: 1s
1988-01-01 00:00:00: 1s
1990-01-01 00:00:00: 1s
1991-01-01 00:00:00: 1s
1992-07-01 00:00:00: 1s
1993-07-01 00:00:00: 1s
1994-07-01 00:00:00: 1s
1996-01-01 00:00:00: 1s
1997-07-01 00:00:00: 1s
1999-01-01 00:00:00: 1s
2006-01-01 00:00:00: 1s
2009-01-01 00:00:00: 1s
2012-07-01 00:00:00: 1s
```

2015-07-01 00:00:00: 1s  
 2017-01-01 00:00:00: 1s

### 29.11.8.2 Member functions

[time.zone.leap.members]

constexpr sys\_seconds date() const noexcept;

*Returns:* The date and time at which the leap second was inserted.

constexpr seconds value() const noexcept;

*Returns:* +1s to indicate a positive leap second or -1s to indicate a negative leap second.

NOTE All leap seconds inserted up through 2022 were positive leap seconds.

### 29.11.8.3 Non-member functions

[time.zone.leap.nonmembers]

constexpr bool operator==(const leap\_second& x, const leap\_second& y) noexcept;

*Returns:* x.date() == y.date().

constexpr strong\_ordering operator<=>(const leap\_second& x, const leap\_second& y) noexcept;

*Returns:* x.date() <=> y.date().

template<class Duration>

constexpr bool operator==(const leap\_second& x, const sys\_time<Duration>& y) noexcept;

*Returns:* x.date() == y.

template<class Duration>

constexpr bool operator<(const leap\_second& x, const sys\_time<Duration>& y) noexcept;

*Returns:* x.date() < y.

template<class Duration>

constexpr bool operator<(const sys\_time<Duration>& x, const leap\_second& y) noexcept;

*Returns:* x < y.date().

template<class Duration>

constexpr bool operator>(const leap\_second& x, const sys\_time<Duration>& y) noexcept;

*Returns:* y < x.

template<class Duration>

constexpr bool operator>(const sys\_time<Duration>& x, const leap\_second& y) noexcept;

*Returns:* y < x.

template<class Duration>

constexpr bool operator<=(const leap\_second& x, const sys\_time<Duration>& y) noexcept;

*Returns:* !(y < x).

template<class Duration>

constexpr bool operator<=(const sys\_time<Duration>& x, const leap\_second& y) noexcept;

*Returns:* !(y < x).

template<class Duration>

constexpr bool operator>=(const leap\_second& x, const sys\_time<Duration>& y) noexcept;

*Returns:* !(x < y).

template<class Duration>

constexpr bool operator>=(const sys\_time<Duration>& x, const leap\_second& y) noexcept;

*Returns:* !(x < y).

template<class Duration>

requires three\_way\_comparable\_with<sys\_seconds, sys\_time<Duration>>

constexpr auto operator<=>(const leap\_second& x, const sys\_time<Duration>& y) noexcept;

*Returns:* x.date() <=> y.

**29.11.9 Class `time_zone_link`****[time.zone.link]****29.11.9.1 Overview****[time.zone.link.overview]**

```

namespace std::chrono {
    class time_zone_link {
    public:
        time_zone_link(time_zone_link&&) = default;
        time_zone_link& operator=(time_zone_link&&) = default;

        // unspecified additional constructors

        string_view name() const noexcept;
        string_view target() const noexcept;
    };
}

```

A `time_zone_link` specifies an alternative name for a `time_zone`. `time_zone_links` are constructed when the time zone database is initialized.

**29.11.9.2 Member functions****[time.zone.link.members]**

```
string_view name() const noexcept;
```

*Returns:* The alternative name for the time zone.

```
string_view target() const noexcept;
```

*Returns:* The name of the `time_zone` for which this `time_zone_link` provides an alternative name.

**29.11.9.3 Non-member functions****[time.zone.link.nonmembers]**

```
bool operator==(const time_zone_link& x, const time_zone_link& y) noexcept;
```

*Returns:* `x.name() == y.name()`.

```
strong_ordering operator<=>(const time_zone_link& x, const time_zone_link& y) noexcept;
```

*Returns:* `x.name() <=> y.name()`.

**29.12 Formatting****[time.format]**

Each `formatter` (22.14.6) specialization in the `chrono` library (29.2) meets the *Formatter* requirements (22.14.6.1). The `parse` member functions of these formatters interpret the format specification as a *chrono-format-spec* according to the following syntax:

```

chrono-format-spec:
    fill-and-alignopt widthopt precisionopt Lopt chrono-specsopt

chrono-specs:
    conversion-spec
    chrono-specs conversion-spec
    chrono-specs literal-char

literal-char:
    any character other than {, }, or %

conversion-spec:
    % modifieropt type

modifier: one of
    E O

type: one of
    a A b B c C d D e F g G h H i j m M n
    p q Q r R S t T u U V w W x X y Y z Z %

```

The productions *fill-and-align*, *width*, and *precision* are described in 22.14.2. Giving a *precision* specification in the *chrono-format-spec* is valid only for types that are specializations of `std::chrono::duration` for which the nested *typedef-name* `rep` denotes a floating-point type. For all other types, an exception of type `format_error` is thrown if the *chrono-format-spec* contains a *precision* specification. All ordinary multibyte characters represented by *literal-char* are copied unchanged to the output.

A *formatting locale* is an instance of `locale` used by a formatting function, defined as

- the "C" locale if the L option is not present in *chrono-format-spec*, otherwise
- the locale passed to the formatting function if any, otherwise
- the global locale.

Each conversion specifier *conversion-spec* is replaced by appropriate characters as described in Table 101; the formats specified in ISO 8601-1:2019 shall be used where so described. Some of the conversion specifiers depend on the formatting locale. If the string literal encoding is a Unicode encoding form and the locale is among an implementation-defined set of locales, each replacement that depends on the locale is performed as if the replacement character sequence is converted to the string literal encoding. If the formatted object does not contain the information the conversion specifier refers to, an exception of type **format\_error** is thrown.

The result of formatting a `std::chrono::duration` instance holding a negative value, or an `hh_mm_ss` object `h` for which `h.is_negative()` is `true`, is equivalent to the output of the corresponding positive value, with a *STATICALLY-WIDEN*<charT>("-") character sequence placed before the replacement of the initial conversion specifier.

EXAMPLE 1

```
cout << format("{:%T}", -10'000s);           // prints: -02:46:40
cout << format("{:%H:%M:%S}", -10'000s);    // prints: -02:46:40
cout << format("minutes {:%M}, hours %H, seconds %S", -10'000s);
                                           // prints: minutes -46, hours 02, seconds 40
```

Unless explicitly requested, the result of formatting a chrono type does not contain time zone abbreviation and time zone offset information. If the information is available, the conversion specifiers `%Z` and `%z` will format this information (respectively).

NOTE If the information is not available and a `%Z` or `%z` conversion specifier appears in the *chrono-format-spec*, an exception of type **format\_error** is thrown, as described above.

If the type being formatted does not contain the information that the format flag needs, an exception of type **format\_error** is thrown.

EXAMPLE 2 A `duration` does not contain enough information to format as a `weekday`.

However, if a flag refers to a “time of day” (e.g., `%H`, `%I`, `%p`, etc.), then a specialization of `duration` is interpreted as the time of day elapsed since midnight.

Table 101 — Meaning of conversion specifiers [tab:time.format.spec]

| Specifier       | Replacement                                                                                                                                                                                                            |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>%a</code> | The locale’s abbreviated weekday name. If the value does not contain a valid weekday, an exception of type <b>format_error</b> is thrown.                                                                              |
| <code>%A</code> | The locale’s full weekday name. If the value does not contain a valid weekday, an exception of type <b>format_error</b> is thrown.                                                                                     |
| <code>%b</code> | The locale’s abbreviated month name. If the value does not contain a valid month, an exception of type <b>format_error</b> is thrown.                                                                                  |
| <code>%B</code> | The locale’s full month name. If the value does not contain a valid month, an exception of type <b>format_error</b> is thrown.                                                                                         |
| <code>%c</code> | The locale’s date and time representation. The modified command <code>%Ec</code> produces the locale’s alternate date and time representation.                                                                         |
| <code>%C</code> | The year divided by 100 using floored division. If the result is a single decimal digit, it is prefixed with 0. The modified command <code>%EC</code> produces the locale’s alternative representation of the century. |
| <code>%d</code> | The day of month as a decimal number. If the result is a single decimal digit, it is prefixed with 0. The modified command <code>%Od</code> produces the locale’s alternative representation.                          |
| <code>%D</code> | Equivalent to <code>%m/%d/%y</code> .                                                                                                                                                                                  |
| <code>%e</code> | The day of month as a decimal number. If the result is a single decimal digit, it is prefixed with a space. The modified command <code>%Oe</code> produces the locale’s alternative representation.                    |
| <code>%F</code> | Equivalent to <code>%Y-%m-%d</code> .                                                                                                                                                                                  |
| <code>%g</code> | The last two decimal digits of the calendar year as specified in ISO 8601-1:2019 for the week calendar. If the result is a single digit it is prefixed by 0.                                                           |

Table 101 — Meaning of conversion specifiers (continued)

| Specifier | Replacement                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| %G        | The calendar year as a decimal number, as specified in ISO 8601-1:2019 for the week calendar. If the result is less than four digits it is left-padded with 0 to four digits.                                                                                                                                                                                                                                                                                                                                                                                                                            |
| %h        | Equivalent to %b.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| %H        | The hour (24-hour clock) as a decimal number. If the result is a single digit, it is prefixed with 0. The modified command %OH produces the locale's alternative representation.                                                                                                                                                                                                                                                                                                                                                                                                                         |
| %I        | The hour (12-hour clock) as a decimal number. If the result is a single digit, it is prefixed with 0. The modified command %OI produces the locale's alternative representation.                                                                                                                                                                                                                                                                                                                                                                                                                         |
| %j        | If the type being formatted is a specialization of <b>duration</b> , the decimal number of <b>days</b> without padding. Otherwise, the day of the year as a decimal number. January 1 is 001. If the result is less than three digits, it is left-padded with 0 to three digits.                                                                                                                                                                                                                                                                                                                         |
| %m        | The month as a decimal number. Jan is 01. If the result is a single digit, it is prefixed with 0. The modified command %Om produces the locale's alternative representation.                                                                                                                                                                                                                                                                                                                                                                                                                             |
| %M        | The minute as a decimal number. If the result is a single digit, it is prefixed with 0. The modified command %OM produces the locale's alternative representation.                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| %n        | A new-line character.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| %p        | The locale's equivalent of the AM/PM designations associated with a 12-hour clock.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| %q        | The duration's unit suffix as specified in 29.5.11.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| %Q        | The duration's numeric value (as if extracted via <code>.count()</code> ).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| %r        | The locale's 12-hour clock time.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| %R        | Equivalent to %H:%M.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| %S        | Seconds as a decimal number. If the number of seconds is less than 10, the result is prefixed with 0. If the precision of the input cannot be exactly represented with seconds, then the format is a decimal floating-point number with a fixed format and a precision matching that of the precision of the input (or to a microseconds precision if the conversion to floating-point decimal seconds cannot be made within 18 fractional digits). The character for the decimal point is localized according to the locale. The modified command %OS produces the locale's alternative representation. |
| %t        | A horizontal-tab character.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| %T        | Equivalent to %H:%M:%S.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| %u        | The calendar day of week as a decimal number (1-7), as specified in ISO 8601-1:2019, where Monday is 1. The modified command %Ou produces the locale's alternative representation.                                                                                                                                                                                                                                                                                                                                                                                                                       |
| %U        | The week number of the year as a decimal number. The first Sunday of the year is the first day of week 01. Days of the same year prior to that are in week 00. If the result is a single digit, it is prefixed with 0. The modified command %OU produces the locale's alternative representation.                                                                                                                                                                                                                                                                                                        |
| %V        | The calendar week of year as a decimal number, as specified in ISO 8601-1:2019 for the week calendar. If the result is a single digit, it is prefixed with 0. The modified command %OV produces the locale's alternative representation.                                                                                                                                                                                                                                                                                                                                                                 |
| %w        | The weekday as a decimal number (0-6), where Sunday is 0. The modified command %Ow produces the locale's alternative representation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| %W        | The week number of the year as a decimal number. The first Monday of the year is the first day of week 01. Days of the same year prior to that are in week 00. If the result is a single digit, it is prefixed with 0. The modified command %OW produces the locale's alternative representation.                                                                                                                                                                                                                                                                                                        |
| %x        | The locale's date representation. The modified command %Ex produces the locale's alternate date representation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| %X        | The locale's time representation. The modified command %EX produces the locale's alternate time representation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| %y        | The last two decimal digits of the year. If the result is a single digit it is prefixed by 0. The modified command %Oy produces the locale's alternative representation. The modified command %Ey produces the locale's alternative representation of offset from %EC (year only).                                                                                                                                                                                                                                                                                                                       |

Table 101 — Meaning of conversion specifiers (continued)

| Specifier | Replacement                                                                                                                                                                                                                                                                                                                                              |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| %Y        | The year as a decimal number. If the result is less than four digits it is left-padded with 0 to four digits. The modified command %EY produces the locale's alternative full year representation.                                                                                                                                                       |
| %z        | The offset from UTC as specified in ISO 8601-1:2019, 5.3.4.1. For example -0430 refers to 4 hours 30 minutes behind UTC. If the offset is zero, +0000 is used. The modified commands %Ez and %Oz insert a : between the hours and minutes: -04:30. If the offset information is not available, an exception of type <code>format_error</code> is thrown. |
| %Z        | The time zone abbreviation. If the time zone abbreviation is not available, an exception of type <code>format_error</code> is thrown.                                                                                                                                                                                                                    |
| %%        | A % character.                                                                                                                                                                                                                                                                                                                                           |

If the *chrono-specs* is omitted, the chrono object is formatted as if by streaming it to `basic_ostringstream<charT> os` with the formatting locale imbued and copying `os.str()` through the output iterator of the context with additional padding and adjustments as specified by the format specifiers.

EXAMPLE 3

```
string s = format("{:=>8}", 42ms);    // value of s is "====42ms"
```

```
template<class Duration, class charT>
struct formatter<chrono::sys_time<Duration>, charT>;
```

*Remarks:* If %Z is used, it is replaced with *STATICALLY-WIDEN*<charT>("UTC"). If %z (or a modified variant of %z) is used, an offset of 0min is formatted.

```
template<class Duration, class charT>
struct formatter<chrono::utc_time<Duration>, charT>;
```

*Remarks:* If %Z is used, it is replaced with *STATICALLY-WIDEN*<charT>("UTC"). If %z (or a modified variant of %z) is used, an offset of 0min is formatted. If the argument represents a time during a positive leap second insertion, and if a seconds field is formatted, the integral portion of that format is *STATICALLY-WIDEN*<charT>("60").

```
template<class Duration, class charT>
struct formatter<chrono::tai_time<Duration>, charT>;
```

*Remarks:* If %Z is used, it is replaced with *STATICALLY-WIDEN*<charT>("TAI"). If %z (or a modified variant of %z) is used, an offset of 0min is formatted. The date and time formatted are equivalent to those formatted by a `sys_time` initialized with

```
sys_time<Duration>{tp.time_since_epoch()} -
(sys_days{1970y/January/1} - sys_days{1958y/January/1})
```

```
template<class Duration, class charT>
struct formatter<chrono::gps_time<Duration>, charT>;
```

*Remarks:* If %Z is used, it is replaced with *STATICALLY-WIDEN*<charT>("GPS"). If %z (or a modified variant of %z) is used, an offset of 0min is formatted. The date and time formatted are equivalent to those formatted by a `sys_time` initialized with

```
sys_time<Duration>{tp.time_since_epoch()} +
(sys_days{1980y/January/Sunday[1]} - sys_days{1970y/January/1})
```

```
template<class Duration, class charT>
struct formatter<chrono::file_time<Duration>, charT>;
```

*Remarks:* If %Z is used, it is replaced with *STATICALLY-WIDEN*<charT>("UTC"). If %z (or a modified variant of %z) is used, an offset of 0min is formatted. The date and time formatted are equivalent to those formatted by a `sys_time` initialized with `clock_cast<system_clock>(t)`, or by a `utc_time` initialized with `clock_cast<utc_clock>(t)`, where `t` is the first argument to `format`.

```
template<class Duration, class charT>
struct formatter<chrono::local_time<Duration>, charT>;
```

*Remarks:* If %Z, %z, or a modified version of %z is used, an exception of type `format_error` is thrown.

```

template<class Duration> struct local-time-format-t {           // exposition only
    local_time<Duration> time;                                   // exposition only
    const string* abbrev;                                       // exposition only
    const seconds* offset_sec;                                   // exposition only
};

template<class Duration>
    local-time-format-t<Duration>
        local_time_format(local_time<Duration> time, const string* abbrev = nullptr,
                           const seconds* offset_sec = nullptr);

    Returns: {time, abbrev, offset_sec}.

template<class Duration, class charT>
    struct formatter<chrono::local-time-format-t<Duration>, charT>;

    Let f be a local-time-format-t<Duration> object passed to formatter::format.

    Remarks: If %Z is used, it is replaced with *f.abbrev if f.abbrev is not a null pointer value. If %Z is
    used and f.abbrev is a null pointer value, an exception of type format_error is thrown. If %z (or a
    modified variant of %z) is used, it is formatted with the value of *f.offset_sec if f.offset_sec is
    not a null pointer value. If %z (or a modified variant of %z) is used and f.offset_sec is a null pointer
    value, then an exception of type format_error is thrown.

template<class Duration, class TimeZonePtr, class charT>
    struct formatter<chrono::zoned_time<Duration, TimeZonePtr>, charT>
    : formatter<chrono::local-time-format-t<Duration>, charT> {
    template<class FormatContext>
        typename FormatContext::iterator
            format(const chrono::zoned_time<Duration, TimeZonePtr>& tp, FormatContext& ctx) const;
};

template<class FormatContext>
    typename FormatContext::iterator
        format(const chrono::zoned_time<Duration, TimeZonePtr>& tp, FormatContext& ctx) const;

    Effects: Equivalent to:

        sys_info info = tp.get_info();
        return formatter<chrono::local-time-format-t<Duration>, charT>::
            format({tp.get_local_time(), &info.abbrev, &info.offset}, ctx);

```

### 29.13 Parsing

[time.parse]

Each *parse* overload specified in this subclause calls *from\_stream* unqualified, so as to enable argument dependent lookup (6.5.4). In the following paragraphs, let *is* denote an object of type *basic\_istream*<charT, traits> and let *I* be *basic\_istream*<charT, traits>&, where *charT* and *traits* are template parameters in that context.

Recommended practice: Implementations should make it difficult to accidentally store or use a manipulator that may contain a dangling reference to a format string, for example by making the manipulators produced by *parse* immovable and preventing stream extraction into an lvalue of such a manipulator type.

```

template<class charT, class Parsable>
    unspecified
        parse(const charT* fmt, Parsable& tp);
template<class charT, class traits, class Alloc, class Parsable>
    unspecified
        parse(const basic_string<charT, traits, Alloc>& fmt, Parsable& tp);

```

Let *F* be *fmt* for the first overload and *fmt.c\_str()* for the second overload. Let *traits* be *char\_traits*<charT> for the first overload.

Constraints: The expression

```
from_stream(declval<basic_istream<charT, traits>&>(), F, tp)
```

is well-formed when treated as an unevaluated operand (7.2.3).

Returns: A manipulator such that the expression *is* >> *parse*(*fmt*, *tp*) has type *I*, has value *is*, and calls *from\_stream*(*is*, *F*, *tp*).

```
template<class charT, class traits, class Alloc, class Parsable>
    unspecified
```

```
    parse(const charT* fmt, Parsable& tp,
           basic_string<charT, traits, Alloc>& abbrev);
```

```
template<class charT, class traits, class Alloc, class Parsable>
    unspecified
```

```
    parse(const basic_string<charT, traits, Alloc>& fmt, Parsable& tp,
           basic_string<charT, traits, Alloc>& abbrev);
```

Let  $F$  be `fmt` for the first overload and `fmt.c_str()` for the second overload.

*Constraints:* The expression

```
from_stream(declval<basic_istream<charT, traits>&>(),  $F$ , tp, addressof(abbrev))
```

is well-formed when treated as an unevaluated operand (7.2.3).

*Returns:* A manipulator such that the expression `>> parse(fmt, tp, abbrev)` has type `I`, has value `is`, and calls `from_stream(is,  $F$ , tp, addressof(abbrev))`.

```
template<class charT, class Parsable>
```

```
    unspecified
```

```
    parse(const charT* fmt, Parsable& tp, minutes& offset);
```

```
template<class charT, class traits, class Alloc, class Parsable>
```

```
    unspecified
```

```
    parse(const basic_string<charT, traits, Alloc>& fmt, Parsable& tp,
           minutes& offset);
```

Let  $F$  be `fmt` for the first overload and `fmt.c_str()` for the second overload. Let `traits` be `char_traits<charT>` and `Alloc` be `allocator<charT>` for the first overload.

*Constraints:* The expression

```
from_stream(declval<basic_istream<charT, traits>&>(),
             $F$ , tp,
            declval<basic_string<charT, traits, Alloc>*>(),
            &offset)
```

is well-formed when treated as an unevaluated operand (7.2.3).

*Returns:* A manipulator such that the expression `>> parse(fmt, tp, offset)` has type `I`, has value `is`, and calls:

```
from_stream(is,
             $F$ , tp,
            static_cast<basic_string<charT, traits, Alloc>*>(nullptr),
            &offset)
```

```
template<class charT, class traits, class Alloc, class Parsable>
```

```
    unspecified
```

```
    parse(const charT* fmt, Parsable& tp,
           basic_string<charT, traits, Alloc>& abbrev, minutes& offset);
```

```
template<class charT, class traits, class Alloc, class Parsable>
```

```
    unspecified
```

```
    parse(const basic_string<charT, traits, Alloc>& fmt, Parsable& tp,
           basic_string<charT, traits, Alloc>& abbrev, minutes& offset);
```

Let  $F$  be `fmt` for the first overload and `fmt.c_str()` for the second overload.

*Constraints:* The expression

```
from_stream(declval<basic_istream<charT, traits>&>(),
             $F$ , tp, addressof(abbrev), &offset)
```

is well-formed when treated as an unevaluated operand (7.2.3).

*Returns:* A manipulator such that the expression `>> parse(fmt, tp, abbrev, offset)` has type `I`, has value `is`, and calls `from_stream(is,  $F$ , tp, addressof(abbrev), &offset)`.

All `from_stream` overloads behave as unformatted input functions, except that they have an unspecified effect on the value returned by subsequent calls to `basic_istream<>::gcount()`. Each overload takes a format string containing ordinary characters and flags which have special meaning. Each flag begins with a `%`. Some flags can be modified by `E` or `O`. During parsing each flag interprets characters as parts of date and

time types according to Table 102. Some flags can be modified by a width parameter given as a positive decimal integer called out as *N* below which governs how many characters are parsed from the stream in interpreting the flag. All characters in the format string that are not represented in Table 102, except for whitespace, are parsed unchanged from the stream. A whitespace character matches zero or more whitespace characters in the input stream.

If the type being parsed cannot represent the information that the format flag refers to, `is.setstate(ios_base::failbit)` is called.

EXAMPLE A `duration` cannot represent a `weekday`.

However, if a flag refers to a “time of day” (e.g., `%H`, `%I`, `%p`, etc.), then a specialization of `duration` is parsed as the time of day elapsed since midnight.

If the `from_stream` overload fails to parse everything specified by the format string, or if insufficient information is parsed to specify a complete duration, time point, or calendrical data structure, `setstate(ios_base::failbit)` is called on the `basic_istream`.

Table 102 — Meaning of parse flags [tab:time.parse.spec]

| Flag            | Parsed value                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>%a</code> | The locale’s full or abbreviated case-insensitive weekday name.                                                                                                                                                                                                                                                                                                                              |
| <code>%A</code> | Equivalent to <code>%a</code> .                                                                                                                                                                                                                                                                                                                                                              |
| <code>%b</code> | The locale’s full or abbreviated case-insensitive month name.                                                                                                                                                                                                                                                                                                                                |
| <code>%B</code> | Equivalent to <code>%b</code> .                                                                                                                                                                                                                                                                                                                                                              |
| <code>%c</code> | The locale’s date and time representation. The modified command <code>%Ec</code> interprets the locale’s alternate date and time representation.                                                                                                                                                                                                                                             |
| <code>%C</code> | The century as a decimal number. The modified command <code>%NC</code> specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command <code>%EC</code> interprets the locale’s alternative representation of the century.                                                           |
| <code>%d</code> | The day of the month as a decimal number. The modified command <code>%Nd</code> specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command <code>%Od</code> interprets the locale’s alternative representation of the day of the month.                                         |
| <code>%D</code> | Equivalent to <code>%m/%d/%y</code> .                                                                                                                                                                                                                                                                                                                                                        |
| <code>%e</code> | Equivalent to <code>%d</code> and can be modified like <code>%d</code> .                                                                                                                                                                                                                                                                                                                     |
| <code>%F</code> | Equivalent to <code>%Y-%m-%d</code> . If modified with a width <i>N</i> , the width is applied to only <code>%Y</code> .                                                                                                                                                                                                                                                                     |
| <code>%g</code> | The last two decimal digits of the calendar year, as specified in ISO 8601-1:2019 for the week calendar. The modified command <code>%Ng</code> specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 2. Leading zeroes are permitted but not required.                                                                                            |
| <code>%G</code> | The calendar year as a decimal number, as specified in ISO 8601-1:2019 for the week calendar. The modified command <code>%NG</code> specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 4. Leading zeroes are permitted but not required.                                                                                                       |
| <code>%h</code> | Equivalent to <code>%b</code> .                                                                                                                                                                                                                                                                                                                                                              |
| <code>%H</code> | The hour (24-hour clock) as a decimal number. The modified command <code>%NH</code> specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command <code>%OH</code> interprets the locale’s alternative representation.                                                             |
| <code>%I</code> | The hour (12-hour clock) as a decimal number. The modified command <code>%NI</code> specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command <code>%OI</code> interprets the locale’s alternative representation.                                                             |
| <code>%j</code> | If the type being parsed is a specialization of <code>duration</code> , a decimal number of <code>days</code> . Otherwise, the day of the year as a decimal number. January 1 is 1. In either case, the modified command <code>%Nj</code> specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 3. Leading zeroes are permitted but not required. |

Table 102 — Meaning of parse flags (continued)

| Flag | Parsed value                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| %m   | The month as a decimal number. January is 1. The modified command %Nm specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command %Om interprets the locale's alternative representation.                                                                                                                                                                                                                                                                         |
| %M   | The minutes as a decimal number. The modified command %NM specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command %OM interprets the locale's alternative representation.                                                                                                                                                                                                                                                                                     |
| %n   | Matches one whitespace character.<br>NOTE %n, %t, and a space can be combined to match a wide range of whitespace patterns. For example, "%n " matches one or more whitespace characters, and "%n%t%t" matches one to three whitespace characters.                                                                                                                                                                                                                                                                                                                            |
| %p   | The locale's equivalent of the AM/PM designations associated with a 12-hour clock.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| %r   | The locale's 12-hour clock time.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| %R   | Equivalent to %H:%M.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| %S   | The seconds as a decimal number. The modified command %NS specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 2 if the input time has a precision convertible to seconds. Otherwise the default width is determined by the decimal precision of the input and the field is interpreted as a <b>long double</b> in a fixed format. If encountered, the locale determines the decimal point character. Leading zeroes are permitted but not required. The modified command %OS interprets the locale's alternative representation. |
| %t   | Matches zero or one whitespace characters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| %T   | Equivalent to %H:%M:%S.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| %u   | The calendar day of week as a decimal number (1-7), as specified in ISO 8601-1:2019, where Monday is 1. The modified command %Nu specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 1. Leading zeroes are permitted but not required.                                                                                                                                                                                                                                                                                           |
| %U   | The week number of the year as a decimal number. The first Sunday of the year is the first day of week 01. Days of the same year prior to that are in week 00. The modified command %NU specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command %OU interprets the locale's alternative representation.                                                                                                                                                       |
| %V   | The calendar week of year as a decimal number, as specified in ISO 8601-1:2019 for the week calendar. The modified command %NV specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 2. Leading zeroes are permitted but not required.                                                                                                                                                                                                                                                                                             |
| %w   | The weekday as a decimal number (0-6), where Sunday is 0. The modified command %Nw specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 1. Leading zeroes are permitted but not required. The modified command %Ow interprets the locale's alternative representation.                                                                                                                                                                                                                                                            |
| %W   | The week number of the year as a decimal number. The first Monday of the year is the first day of week 01. Days of the same year prior to that are in week 00. The modified command %NW specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command %OW interprets the locale's alternative representation.                                                                                                                                                       |
| %x   | The locale's date representation. The modified command %Ex interprets the locale's alternate date representation.                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| %X   | The locale's time representation. The modified command %EX interprets the locale's alternate time representation.                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

Table 102 — Meaning of parse flags (continued)

| Flag | Parsed value                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| %y   | The last two decimal digits of the year. If the century is not otherwise specified (e.g., with %C), values in the range [69, 99] are presumed to refer to the years 1969 to 1999, and values in the range [00, 68] are presumed to refer to the years 2000 to 2068. The modified command %Ny specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 2. Leading zeroes are permitted but not required. The modified commands %Ey and %Oy interpret the locale's alternative representation. |
| %Y   | The year as a decimal number. The modified command %NY specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 4. Leading zeroes are permitted but not required. The modified command %EY interprets the locale's alternative representation.                                                                                                                                                                                                                                               |
| %z   | The offset from UTC in the format [+ -]hh[mm]. For example -0430 refers to 4 hours 30 minutes behind UTC, and 04 refers to 4 hours ahead of UTC. The modified commands %Ez and %Oz parse a : between the hours and minutes and render leading zeroes on the hour field optional: [+ -]h[h] [:mm]. For example -04:30 refers to 4 hours 30 minutes behind UTC, and 4 refers to 4 hours ahead of UTC.                                                                                                                                  |
| %Z   | The time zone abbreviation or name. A single word is parsed. This word can only contain characters from the basic character set (5.3) that are alphanumeric, or one of ' _ ', ' / ', ' - ', or ' + '.                                                                                                                                                                                                                                                                                                                                |
| %%   | A % character is extracted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## 29.14 Header &lt;ctime&gt; synopsis

[ctime.syn]

```

#define NULL see 17.2.3
#define CLOCKS_PER_SEC see below
#define TIME_UTC see below

namespace std {
    using size_t = see 17.2.4;
    using clock_t = see below;
    using time_t = see below;

    struct timespec;
    struct tm;

    clock_t clock();
    double difftime(time_t time1, time_t time0);
    time_t mktime(tm* timeptr);
    time_t time(time_t* timer);
    int timespec_get(timespec* ts, int base);
    char* asctime(const tm* timeptr);
    char* ctime(const time_t* timer);
    tm* gmtime(const time_t* timer);
    tm* localtime(const time_t* timer);
    size_t strftime(char* s, size_t maxsize, const char* format, const tm* timeptr);
}

```

The contents of the header <ctime> are the same as the C standard library header <time.h>.<sup>239</sup>

The functions asctime, ctime, gmtime, and localtime are not required to avoid data races (16.4.6.10).

See also ISO/IEC 9899:2018, 7.27.

<sup>239</sup>) strftime supports the C conversion specifiers C, D, e, F, g, G, h, r, R, t, T, u, V, and z, and the modifiers E and O.

30

Localization library

[localization]

30.1

General

[localization.general]

This Clause describes components that C++ programs may use to encapsulate (and therefore be more portable when confronting) cultural differences. The locale facility includes internationalization support for character classification and string collation, numeric, monetary, and date/time formatting and parsing, and message retrieval.

The following subclauses describe components for locales themselves, the standard facets, and facilities from the C library, as summarized in [Table 103](#).

Table 103 — Localization library summary [tab:localization.summary]

|      | Subclause                  | Header    |
|------|----------------------------|-----------|
| 30.3 | Locales                    | <locale>  |
| 30.4 | Standard locale categories |           |
| 30.5 | C library locales          | <clocale> |

30.2

Header <locale> synopsis

[locale.syn]

```
namespace std {
    // 30.3.1, locale
    class locale;
    template<class Facet> const Facet& use_facet(const locale&);
    template<class Facet> bool has_facet(const locale&) noexcept;

    // 30.3.3, convenience interfaces
    template<class charT> bool isspace (charT c, const locale& loc);
    template<class charT> bool isprint (charT c, const locale& loc);
    template<class charT> bool iscntrl (charT c, const locale& loc);
    template<class charT> bool isupper (charT c, const locale& loc);
    template<class charT> bool islower (charT c, const locale& loc);

    class money_get;
template<class charT, class OutputIterator = ostreambuf_iterator<charT>>
    class money_put;
template<class charT, bool Intl = false>
    class moneypunct;
template<class charT, bool Intl = false>
    class moneypunct_byname;

// 30.4.8, message retrieval
class messages_base;
template<class charT> class messages;
template<class charT> class messages_byname;
}

```

The header `<locale>` defines classes and declares functions that encapsulate and manipulate the information peculiar to a locale.<sup>240</sup>

### 30.3 Locales

[locales]

#### 30.3.1 Class `locale`

[locale]

##### 30.3.1.1 General

[locale.general]

```

namespace std {
    class locale {
    public:
        // types
        class facet;
        class id;
        using category = int;
        static const category // values assigned here are for exposition only
            none = 0,
            collate = 0x010, ctype = 0x020,
            monetary = 0x040, numeric = 0x080,
            time = 0x100, messages = 0x200,
            all = collate | ctype | monetary | numeric | time | messages;

        // construct/copy/destroy
        locale() noexcept;
        locale(const locale& other) noexcept;
        explicit locale(const char* std_name);
        explicit locale(const string& std_name);
        locale(const locale& other, const char* std_name, category);
    };
}

```

<sup>240</sup>) In this subclause, the type name `tm` is an incomplete type that is defined in `<ctime>` (29.14).

```

    locale(const locale& other, const string& std_name, category);
    template<class Facet> locale(const locale& other, Facet* f);
    locale(const locale& other, const locale& one, category);
    ~locale(); // not virtual
    const locale& operator=(const locale& other) noexcept;
    template<class Facet> locale combine(const locale& other) const;

    // locale operations
    string name() const;

    bool operator==(const locale& other) const;

    template<class charT, class traits, class Allocator>
        bool operator()(const basic_string<charT, traits, Allocator>& s1,
                        const basic_string<charT, traits, Allocator>& s2) const;

    // global locale objects
    static locale global(const locale&);
    static const locale& classic();
};
}

```

Class `locale` implements a type-safe polymorphic set of facets, indexed by facet *type*. In other words, a facet has a dual role: in one sense, it's just a class interface; at the same time, it's an index into a locale's set of facets.

Access to the facets of a `locale` is via two function templates, `use_facet<>` and `has_facet<>`.

EXAMPLE An `ostream operator<<` can be implemented as:<sup>241</sup>

```

template<class charT, class traits>
basic_ostream<charT, traits>&
operator<< (basic_ostream<charT, traits>& s, Date d) {
    typename basic_ostream<charT, traits>::sentry cerberos(s);
    if (cerberos) {
        tm tmbuf; d.extract(tmbuf);
        bool failed =
            use_facet<time_put<charT, ostreambuf_iterator<charT, traits>>>(
                s.getloc()).put(s, s, s.fill(), &tmbuf, 'x').failed();
        if (failed)
            s.setstate(s.badbit); // can throw
    }
    return s;
}

```

In the call to `use_facet<Facet>(loc)`, the type argument chooses a facet, making available all members of the named type. If `Facet` is not present in a locale, it throws the standard exception `bad_cast`. A C++ program can check if a locale implements a particular facet with the function template `has_facet<Facet>()`. User-defined facets may be installed in a locale, and used identically as may standard facets.

NOTE All locale semantics are accessed via `use_facet<>` and `has_facet<>`, except that:

- A member operator template

```
operator()(const basic_string<C, T, A>&, const basic_string<C, T, A>&)
```

is provided so that a locale can be used as a predicate argument to the standard collections, to collate strings.

- Convenient global interfaces are provided for traditional `ctype` functions such as `isdigit()` and `isspace()`, so that given a locale object `loc` a C++ program can call `isspace(c, loc)`. (This eases upgrading existing extractors (31.7.5.3).)

Once a facet reference is obtained from a locale object by calling `use_facet<>`, that reference remains usable, and the results from member functions of it may be cached and re-used, as long as some locale object refers to that facet.

In successive calls to a locale facet member function on a facet object installed in the same locale, the returned result shall be identical.

<sup>241</sup>) Note that in the call to `put`, the stream is implicitly converted to an `ostreambuf_iterator<charT, traits>`.

A **locale** constructed from a name string (such as "POSIX"), or from parts of two named locales, has a name; all others do not. Named locales may be compared for equality; an unnamed locale is equal only to (copies of) itself. For an unnamed locale, `locale::name()` returns the string "\*".

Whether there is one global locale object for the entire program or one global locale object per thread is implementation-defined. Implementations should provide one global locale object per thread. If there is a single global locale object for the entire program, implementations are not required to avoid data races on it (16.4.6.10).

### 30.3.1.2 Types

[locale.types]

#### 30.3.1.2.1 Type `locale::category`

[locale.category]

```
using category = int;
```

Valid **category** values include the **locale** member bitmask elements **collate**, **ctype**, **monetary**, **numeric**, **time**, and **messages**, each of which represents a single locale category. In addition, **locale** member bitmask constant **none** is defined as zero and represents no category. And **locale** member bitmask constant **all** is defined such that the expression

```
(collate | ctype | monetary | numeric | time | messages | all) == all
```

is **true**, and represents the union of all categories. Further, the expression  $(X \mid Y)$ , where  $X$  and  $Y$  each represent a single category, represents the union of the two categories.

**locale** member functions expecting a **category** argument require one of the **category** values defined above, or the union of two or more such values. Such a **category** value identifies a set of locale categories. Each locale category, in turn, identifies a set of locale facets, including at least those shown in Table 104.

**Table 104 — Locale category facets** [tab:locale.category.facets]

| Category | Includes facets                                                                                                                                                                                                                                                                                                                      |
|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| collate  | <code>collate&lt;char&gt;</code> , <code>collate&lt;wchar_t&gt;</code>                                                                                                                                                                                                                                                               |
| ctype    | <code>ctype&lt;char&gt;</code> , <code>ctype&lt;wchar_t&gt;</code><br><code>codecvt&lt;char, char, mbstate_t&gt;</code><br><code>codecvt&lt;char16_t, char8_t, mbstate_t&gt;</code><br><code>codecvt&lt;char32_t, char8_t, mbstate_t&gt;</code><br><code>codecvt&lt;wchar_t, char, mbstate_t&gt;</code>                              |
| monetary | <code>moneypunct&lt;char&gt;</code> , <code>moneypunct&lt;wchar_t&gt;</code><br><code>moneypunct&lt;char, true&gt;</code> , <code>moneypunct&lt;wchar_t, true&gt;</code><br><code>money_get&lt;char&gt;</code> , <code>money_get&lt;wchar_t&gt;</code><br><code>money_put&lt;char&gt;</code> , <code>money_put&lt;wchar_t&gt;</code> |
| numeric  | <code>numput&lt;char&gt;</code> , <code>numput&lt;wchar_t&gt;</code><br><code>num_get&lt;char&gt;</code> , <code>num_get&lt;wchar_t&gt;</code><br><code>num_put&lt;char&gt;</code> , <code>num_put&lt;wchar_t&gt;</code>                                                                                                             |
| time     | <code>time_get&lt;char&gt;</code> , <code>time_get&lt;wchar_t&gt;</code><br><code>time_put&lt;char&gt;</code> , <code>time_put&lt;wchar_t&gt;</code>                                                                                                                                                                                 |
| messages | <code>messages&lt;char&gt;</code> , <code>messages&lt;wchar_t&gt;</code>                                                                                                                                                                                                                                                             |

For any locale `loc` either constructed, or returned by `locale::classic()`, and any facet `Facet` shown in Table 104, `has_facet<Facet>(loc)` is **true**. Each locale member function which takes a `locale::category` argument operates on the corresponding set of facets.

An implementation is required to provide those specializations for facet templates identified as members of a category, and for those shown in Table 105.

The provided implementation of members of facets `num_get<charT>` and `num_put<charT>` calls `use_facet<F>(1)` only for facet  $F$  of types `numput<charT>` and `ctype<charT>`, and for locale  $l$  the value obtained by calling member `getloc()` on the `ios_base&` argument to these functions.

In declarations of facets, a template parameter with name `InputIterator` or `OutputIterator` indicates the set of all possible specializations on parameters that meet the *Cpp17InputIterator* requirements or *Cpp17OutputIterator* requirements, respectively (25.3). A template parameter with name  $C$  represents the set of types containing `char`, `wchar_t`, and any other implementation-defined character types that meet the

Table 105 — Required specializations [tab:locale.spec]

| Category | Includes facets                                                                                                                                                                                                                                                                                                  |
|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| collate  | collate_byname<char>, collate_byname<wchar_t>                                                                                                                                                                                                                                                                    |
| ctype    | ctype_byname<char>, ctype_byname<wchar_t><br>codecvt_byname<char, char, mbstate_t><br>codecvt_byname<char16_t, char8_t, mbstate_t><br>codecvt_byname<char32_t, char8_t, mbstate_t><br>codecvt_byname<wchar_t, char, mbstate_t>                                                                                   |

| numeric  | numpunct_byname<char>, numpunct_byname<wchar_t><br>num_get<C, InputIterator>, num_put<C, OutputIterator>                                                                                                                                                                                                         |
| time     | time_get<char, InputIterator><br>time_get_byname<char, InputIterator><br>time_get<wchar_t, InputIterator><br>time_get_byname<wchar_t, InputIterator><br>time_put<char, OutputIterator><br>time_put_byname<char, OutputIterator><br>time_put<wchar_t, OutputIterator><br>time_put_byname<wchar_t, OutputIterator> |
| messages | messages_byname<char>, messages_byname<wchar_t>                                                                                                                                                                                                                                                                  |

requirements for a character on which any of the `iostream` components can be instantiated. A template parameter with name `International` represents the set of all possible specializations on a `bool` parameter.

### 30.3.1.2.2 Class `locale::facet`

[locale.facet]

```
namespace std {
    class locale::facet {
    protected:
        explicit facet(size_t refs = 0);
        virtual ~facet();
        facet(const facet&) = delete;
        void operator=(const facet&) = delete;
    };
}
```

Class `facet` is the base class for locale feature sets. A class is a *facet* if it is publicly derived from another facet, or if it is a class derived from `locale::facet` and contains a publicly accessible declaration as follows:<sup>242</sup>

```
static ::std::locale::id id;
```

Template parameters in this Clause which are required to be facets are those named `Facet` in declarations. A program that passes a type that is *not* a facet, or a type that refers to a volatile-qualified facet, as an (explicit or deduced) template parameter to a locale function expecting a facet, is ill-formed. A const-qualified facet is a valid template argument to any locale function that expects a `Facet` template parameter.

The `refs` argument to the constructor is used for lifetime management. For `refs == 0`, the implementation performs `delete static_cast<locale::facet*>(f)` (where `f` is a pointer to the facet) when the last `locale` object containing the facet is destroyed; for `refs == 1`, the implementation never destroys the facet.

Constructors of all facets defined in this Clause take such an argument and pass it along to their `facet` base class constructor. All one-argument constructors defined in this Clause are *explicit*, preventing their participation in implicit conversions.

For some standard facets a standard “...\_byname” class, derived from it, implements the virtual function semantics equivalent to that facet of the locale constructed by `locale(const char*)` with the same name.

<sup>242</sup>) This is a complete list of requirements; there are no other requirements. Thus, a facet class need not have a public copy constructor, assignment, default constructor, destructor, etc.

Each such facet provides a constructor that takes a `const char*` argument, which names the locale, and a `refs` argument, which is passed to the base class constructor. Each such facet also provides a constructor that takes a `string` argument `str` and a `refs` argument, which has the same effect as calling the first constructor with the two arguments `str.c_str()` and `refs`. If there is no “`...byname`” version of a facet, the base class implements named locale semantics itself by reference to other facets.

### 30.3.1.2.3 Class `locale::id`

[locale.id]

```
namespace std {
    class locale::id {
    public:
        id();
        void operator=(const id&) = delete;
        id(const id&) = delete;
    };
}
```

The class `locale::id` provides identification of a locale facet interface, used as an index for lookup and to encapsulate initialization.

NOTE Because facets are used by iostreams, potentially while static constructors are running, it is not possible for their initialization to depend on programmed static initialization. One initialization strategy is for `locale` to initialize each facet's `id` member the first time an instance of the facet is installed into a locale. This depends only on static storage being zero before constructors run (6.9.3.2).

### 30.3.1.3 Constructors and destructor

[locale.cons]

```
locale() noexcept;
```

*Effects:* Constructs a copy of the argument last passed to `locale::global(locale&)`, if it has been called; else, the resulting facets have virtual function semantics identical to those of `locale::classic()`.

NOTE This constructor yields a copy of the current global locale. It is commonly used as a default argument for function parameters of type `const locale&`.

```
explicit locale(const char* std_name);
```

*Effects:* Constructs a locale using standard C locale names, e.g., "POSIX". The resulting locale implements semantics defined to be associated with that name.

*Throws:* `runtime_error` if the argument is not valid, or is null.

*Remarks:* The set of valid string argument values is "C", "", and any implementation-defined values.

```
explicit locale(const string& std_name);
```

*Effects:* Equivalent to `locale(std_name.c_str())`.

```
locale(const locale& other, const char* std_name, category cats);
```

*Preconditions:* `cats` is a valid `category` value (30.3.1.2.1).

*Effects:* Constructs a locale as a copy of `other` except for the facets identified by the `category` argument, which instead implement the same semantics as `locale(std_name)`.

*Throws:* `runtime_error` if the second argument is not valid, or is null.

*Remarks:* The locale has a name if and only if `other` has a name.

```
locale(const locale& other, const string& std_name, category cats);
```

*Effects:* Equivalent to `locale(other, std_name.c_str(), cats)`.

```
template<class Facet> locale(const locale& other, Facet* f);
```

*Effects:* Constructs a locale incorporating all facets from the first argument except that of type `Facet`, and installs the second argument as the remaining facet. If `f` is null, the resulting object is a copy of `other`.

*Remarks:* If `f` is null, the resulting locale has the same name as `other`. Otherwise, the resulting locale has no name.

```
locale(const locale& other, const locale& one, category cats);
```

*Preconditions:* `cats` is a valid `category` value.

*Effects:* Constructs a locale incorporating all facets from the first argument except those that implement `cats`, which are instead incorporated from the second argument.

*Remarks:* If `cats` is equal to `locale::none`, the resulting locale has a name if and only if the first argument has a name. Otherwise, the resulting locale has a name if and only if the first two arguments both have names.

```
const locale& operator=(const locale& other) noexcept;
```

*Effects:* Creates a copy of `other`, replacing the current value.

*Returns:* `*this`.

#### 30.3.1.4 Members

[`locale.members`]

```
template<class Facet> locale combine(const locale& other) const;
```

*Effects:* Constructs a locale incorporating all facets from `*this` except for that one facet of `other` that is identified by `Facet`.

*Returns:* The newly created locale.

*Throws:* `runtime_error` if `has_facet<Facet>(other)` is false.

*Remarks:* The resulting locale has no name.

```
string name() const;
```

*Returns:* The name of `*this`, if it has one; otherwise, the string `"*"`.

#### 30.3.1.5 Operators

[`locale.operators`]

```
bool operator==(const locale& other) const;
```

*Returns:* `true` if both arguments are the same locale, or one is a copy of the other, or each has a name and the names are identical; `false` otherwise.

```
template<class charT, class traits, class Allocator>
bool operator()(const basic_string<charT, traits, Allocator>& s1,
                const basic_string<charT, traits, Allocator>& s2) const;
```

*Effects:* Compares two strings according to the `collate<charT>` facet.

*Returns:*

```
use_facet<collate<charT>>(*this).compare(s1.data(), s1.data() + s1.size(),
                                         s2.data(), s2.data() + s2.size()) < 0
```

*Remarks:* This member operator template (and therefore `locale` itself) meets the requirements for a comparator predicate template argument ([Clause 27](#)) applied to strings.

EXAMPLE A vector of strings `v` can be collated according to collation rules in locale `loc` simply by ([27.8.2](#), [24.3.11](#)):

```
std::sort(v.begin(), v.end(), loc);
```

#### 30.3.1.6 Static members

[`locale.statics`]

```
static locale global(const locale& loc);
```

*Effects:* Sets the global locale to its argument. Causes future calls to the constructor `locale()` to return a copy of the argument. If the argument has a name, does

```
setlocale(LC_ALL, loc.name().c_str());
```

otherwise, the effect on the C locale, if any, is implementation-defined.

*Returns:* The previous value of `locale()`.

*Remarks:* No library function other than `locale::global()` affects the value returned by `locale()`.

NOTE See [30.5](#) for data race considerations when `setlocale` is invoked.

```
static const locale& classic();
```

The "C" locale.

*Returns:* A locale that implements the classic "C" locale semantics, equivalent to the value `locale("C")`.

*Remarks:* This locale, its facets, and their member functions, do not change with time.

### 30.3.2 locale globals

[[locale.global.templates](#)]

```
template<class Facet> const Facet& use_facet(const locale& loc);
```

*Mandates:* Facet is a facet class whose definition contains the public static member `id` as defined in [30.3.1.2.2](#).

*Returns:* A reference to the corresponding facet of `loc`, if present.

*Throws:* `bad_cast` if `has_facet<Facet>(loc)` is false.

*Remarks:* The reference returned remains valid at least as long as any copy of `loc` exists.

```
template<class Facet> bool has_facet(const locale& loc) noexcept;
```

*Returns:* `true` if the facet requested is present in `loc`; otherwise `false`.

### 30.3.3 Convenience interfaces

[[locale.convenience](#)]

#### 30.3.3.1 Character classification

[[classification](#)]

```
template<class charT> bool isspace (charT c, const locale& loc);
template<class charT> bool isprint (charT c, const locale& loc);
template<class charT> bool iscntrl (charT c, const locale& loc);
template<class charT> bool isupper (charT c, const locale& loc);
template<class charT> bool islower (charT c, const locale& loc);
template<class charT> bool isalpha (charT c, const locale& loc);
template<class charT> bool isdigit (charT c, const locale& loc);
template<class charT> bool ispunct (charT c, const locale& loc);
template<class charT> bool isxdigit(charT c, const locale& loc);
template<class charT> bool isalnum (charT c, const locale& loc);
template<class charT> bool isgraph (charT c, const locale& loc);
template<class charT> bool isblank (charT c, const locale& loc);
```

Each of these functions `isF` returns the result of the expression:

```
use_facet<ctype<charT>>(loc).is(ctype_base::F, c)
```

where *F* is the `ctype_base::mask` value corresponding to that function ([30.4.2](#)).<sup>243</sup>

#### 30.3.3.2 Character conversions

[[conversions.character](#)]

```
template<class charT> charT toupper(charT c, const locale& loc);
```

*Returns:* `use_facet<ctype<charT>>(loc).toupper(c)`.

```
template<class charT> charT tolower(charT c, const locale& loc);
```

*Returns:* `use_facet<ctype<charT>>(loc).tolower(c)`.

## 30.4 Standard locale categories

[[locale.categories](#)]

### 30.4.1 General

[[locale.categories.general](#)]

Each of the standard categories includes a family of facets. Some of these implement formatting or parsing of a datum, for use by standard or users' iostream operators `<<` and `>>`, as members `put()` and `get()`, respectively. Each such member function takes an `ios_base&` argument whose members `flags()`, `precision()`, and `width()`, specify the format of the corresponding datum ([31.5.2](#)). Those functions which need to use other facets call its member `getloc()` to retrieve the locale imbued there. Formatting facets use the character argument `fill` to fill out the specified width where necessary.

The `put()` members make no provision for error reporting. (Any failures of the `OutputIterator` argument can be extracted from the returned iterator.) The `get()` members take an `ios_base::iostate&` argument whose value they ignore, but set to `ios_base::failbit` in case of a parse error.

<sup>243</sup>) When used in a loop, it is faster to cache the `ctype<>` facet and use it directly, or use the vector form of `ctype<>::is`.

Within 30.4 it is unspecified whether one virtual function calls another virtual function.

### 30.4.2 The ctype category

[category.ctype]

#### 30.4.2.1 General

[category.ctype.general]

```
namespace std {
    class ctype_base {
    public:
        using mask = see below;

        // numeric values are for exposition only.
        static const mask space = 1 << 0;
        static const mask print = 1 << 1;
        static const mask cntrl = 1 << 2;
        static const mask upper = 1 << 3;
        static const mask lower = 1 << 4;
        static const mask alpha = 1 << 5;
        static const mask digit = 1 << 6;
        static const mask punct = 1 << 7;
        static const mask xdigit = 1 << 8;
        static const mask blank = 1 << 9;
        static const mask alnum = alpha | digit;
        static const mask graph = alnum | punct;
    };
}
```

The type mask is a bitmask type (16.3.3.3.3).

#### 30.4.2.2 Class template ctype

[locale.ctype]

##### 30.4.2.2.1 General

[locale.ctype.general]

```
namespace std {
    template<class charT>
    class ctype : public locale::facet, public ctype_base {
    public:
        using char_type = charT;

        explicit ctype(size_t refs = 0);

        bool is(mask m, charT c) const;
        const charT* is(const charT* low, const charT* high, mask* vec) const;
        const charT* scan_is(mask m, const charT* low, const charT* high) const;
        const charT* scan_not(mask m, const charT* low, const charT* high) const;
        charT toupper(charT c) const;
        const charT* toupper(charT* low, const charT* high) const;
        charT tolower(charT c) const;
        const charT* tolower(charT* low, const charT* high) const;

        charT widen(char c) const;
        const char* widen(const char* low, const char* high, charT* to) const;
        char narrow(charT c, char default) const;
        const charT* narrow(const charT* low, const charT* high, char default, char* to) const;

        static locale::id id;

    protected:
        ~ctype();
        virtual bool do_is(mask m, charT c) const;
        virtual const charT* do_is(const charT* low, const charT* high, mask* vec) const;
        virtual const charT* do_scan_is(mask m, const charT* low, const charT* high) const;
        virtual const charT* do_scan_not(mask m, const charT* low, const charT* high) const;
        virtual charT do_toupper(charT) const;
        virtual const charT* do_toupper(charT* low, const charT* high) const;
        virtual charT do_tolower(charT) const;
        virtual const charT* do_tolower(charT* low, const charT* high) const;
    };
}
```

```

    virtual charT      do_widen(char) const;
    virtual const char* do_widen(const char* low, const char* high, charT* dest) const;
    virtual char        do_narrow(charT, char default) const;
    virtual const charT* do_narrow(const charT* low, const charT* high,
                                   char default, char* dest) const;
};
}

```

Class `ctype` encapsulates the C library `<cctype>` features. `istream` members are required to use `ctype<>` for character classing during input parsing.

The specializations required in Table 104 (30.3.1.2.1), namely `ctype<char>` and `ctype<wchar_t>`, implement character classing appropriate to the implementation's native character set.

#### 30.4.2.2.2 `ctype` members

[`locale.ctype.members`]

```

bool      is(mask m, charT c) const;
const charT* is(const charT* low, const charT* high, mask* vec) const;

```

*Returns:* `do_is(m, c)` or `do_is(low, high, vec)`.

```

const charT* scan_is(mask m, const charT* low, const charT* high) const;

```

*Returns:* `do_scan_is(m, low, high)`.

```

const charT* scan_not(mask m, const charT* low, const charT* high) const;

```

*Returns:* `do_scan_not(m, low, high)`.

```

charT      toupper(charT) const;
const charT* toupper(charT* low, const charT* high) const;

```

*Returns:* `do_toupper(c)` or `do_toupper(low, high)`.

```

charT      tolower(charT c) const;
const charT* tolower(charT* low, const charT* high) const;

```

*Returns:* `do_tolower(c)` or `do_tolower(low, high)`.

```

charT      widen(char c) const;
const char* widen(const char* low, const char* high, charT* to) const;

```

*Returns:* `do_widen(c)` or `do_widen(low, high, to)`.

```

char      narrow(charT c, char default) const;
const charT* narrow(const charT* low, const charT* high, char default, char* to) const;

```

*Returns:* `do_narrow(c, default)` or `do_narrow(low, high, default, to)`.

#### 30.4.2.2.3 `ctype` virtual functions

[`locale.ctype.virtuals`]

```

bool      do_is(mask m, charT c) const;
const charT* do_is(const charT* low, const charT* high, mask* vec) const;

```

*Effects:* Classifies a character or sequence of characters. For each argument character, identifies a value `M` of type `ctype_base::mask`. The second form identifies a value `M` of type `ctype_base::mask` for each `*p` where `(low <= p && p < high)`, and places it into `vec[p - low]`.

*Returns:* The first form returns the result of the expression `(M & m) != 0`; i.e., `true` if the character has the characteristics specified. The second form returns `high`.

```

const charT* do_scan_is(mask m, const charT* low, const charT* high) const;

```

*Effects:* Locates a character in a buffer that conforms to a classification `m`.

*Returns:* The smallest pointer `p` in the range `[low, high)` such that `is(m, *p)` would return `true`; otherwise, returns `high`.

```

const charT* do_scan_not(mask m, const charT* low, const charT* high) const;

```

*Effects:* Locates a character in a buffer that fails to conform to a classification `m`.

*Returns:* The smallest pointer `p`, if any, in the range `[low, high)` such that `is(m, *p)` would return `false`; otherwise, returns `high`.

```
charT do_toupper(charT c) const;
const charT* do_toupper(charT* low, const charT* high) const;
```

*Effects:* Converts a character or characters to upper case. The second form replaces each character *\*p* in the range *[low, high)* for which a corresponding upper-case character exists, with that character.

*Returns:* The first form returns the corresponding upper-case character if it is known to exist, or its argument if not. The second form returns *high*.

```
charT do_tolower(charT c) const;
const charT* do_tolower(charT* low, const charT* high) const;
```

*Effects:* Converts a character or characters to lower case. The second form replaces each character *\*p* in the range *[low, high)* and for which a corresponding lower-case character exists, with that character.

*Returns:* The first form returns the corresponding lower-case character if it is known to exist, or its argument if not. The second form returns *high*.

```
charT do_widen(char c) const;
const char* do_widen(const char* low, const char* high, charT* dest) const;
```

*Effects:* Applies the simplest reasonable transformation from a *char* value or sequence of *char* values to the corresponding *charT* value or values.<sup>244</sup> The only characters for which unique transformations are required are those in the basic character set (5.3).

For any named *ctype* category with a *ctype<charT>* facet *ctc* and valid *ctype\_base::mask* value *M*, *(ctc.is(M, c) || !is(M, do\_widen(c)) )* is true.<sup>245</sup>

The second form transforms each character *\*p* in the range *[low, high)*, placing the result in *dest[p - low]*.

*Returns:* The first form returns the transformed value. The second form returns *high*.

```
char do_narrow(charT c, char dfault) const;
const charT* do_narrow(const charT* low, const charT* high, char dfault, char* dest) const;
```

*Effects:* Applies the simplest reasonable transformation from a *charT* value or sequence of *charT* values to the corresponding *char* value or values.

For any character *c* in the basic character set (5.3) the transformation is such that

```
do_widen(do_narrow(c, 0)) == c
```

For any named *ctype* category with a *ctype<char>* facet *ctc* however, and *ctype\_base::mask* value *M*,

```
(is(M, c) || !ctc.is(M, do_narrow(c, dfault)))
```

is true (unless *do\_narrow* returns *dfault*). In addition, for any digit character *c*, the expression *(do\_narrow(c, dfault) - '0')* evaluates to the digit value of the character. The second form transforms each character *\*p* in the range *[low, high)*, placing the result (or *dfault* if no simple transformation is readily available) in *dest[p - low]*.

*Returns:* The first form returns the transformed value; or *dfault* if no mapping is readily available. The second form returns *high*.

#### 30.4.2.3 Class template *ctype\_byname*

[*locale.ctype.byname*]

```
namespace std {
    template<class charT>
        class ctype_byname : public ctype<charT> {
        public:
            using mask = typename ctype<charT>::mask;
            explicit ctype_byname(const char*, size_t refs = 0);
            explicit ctype_byname(const string&, size_t refs = 0);

        protected:
            ~ctype_byname();
        };
```

244) The parameter *c* of *do\_widen* is intended to accept values derived from *character-literals* for conversion to the locale's encoding.

245) In other words, the transformed character is not a member of any character classification that *c* is not also a member of.

```
};
}
```

### 30.4.2.4 ctype<char> specialization

[facet.ctype.special]

#### 30.4.2.4.1 General

[facet.ctype.special.general]

```
namespace std {
    template<>
    class ctype<char> : public locale::facet, public ctype_base {
    public:
        using char_type = char;

        explicit ctype(const mask* tab = nullptr, bool del = false, size_t refs = 0);

        bool is(mask m, char c) const;
        const char* is(const char* low, const char* high, mask* vec) const;
        const char* scan_is (mask m, const char* low, const char* high) const;
        const char* scan_not(mask m, const char* low, const char* high) const;

        char toupper(char c) const;
        const char* toupper(char* low, const char* high) const;
        char tolower(char c) const;
        const char* tolower(char* low, const char* high) const;

        char widen(char c) const;
        const char* widen(const char* low, const char* high, char* to) const;
        char narrow(char c, char default) const;
        const char* narrow(const char* low, const char* high, char default, char* to) const;

        static locale::id id;
        static const size_t table_size = implementation-defined;

        const mask* table() const noexcept;
        static const mask* classic_table() noexcept;

    protected:
        ~ctype();
        virtual char do_toupper(char c) const;
        virtual const char* do_toupper(char* low, const char* high) const;
        virtual char do_tolower(char c) const;
        virtual const char* do_tolower(char* low, const char* high) const;

        virtual char do_widen(char c) const;
        virtual const char* do_widen(const char* low, const char* high, char* to) const;
        virtual char do_narrow(char c, char default) const;
        virtual const char* do_narrow(const char* low, const char* high,
                                     char default, char* to) const;
    };
}
```

A specialization `ctype<char>` is provided so that the member functions on type `char` can be implemented inline.<sup>246</sup> The implementation-defined value of member `table_size` is at least 256.

#### 30.4.2.4.2 Destructor

[facet.ctype.char.dtor]

```
~ctype();
```

*Effects:* If the constructor's first argument was nonzero, and its second argument was `true`, does `delete [] table()`.

<sup>246</sup> Only the `char` (not `unsigned char` and `signed char`) form is provided. The specialization is specified in the standard, and not left as an implementation detail, because it affects the derivation interface for `ctype<char>`.

**30.4.2.4.3 Members****[facet.ctype.char.members]**

In the following member descriptions, for `unsigned char` values `v` where `v >= table_size`, `table()[v]` is assumed to have an implementation-specific value (possibly different for each such value `v`) without performing the array lookup.

```
explicit ctype(const mask* tbl = nullptr, bool del = false, size_t refs = 0);
```

*Preconditions:* Either `tbl == nullptr` is true or `[tbl, tbl+table_size)` is a valid range.

*Effects:* Passes its `refs` argument to its base class constructor.

```
bool is(mask m, char c) const;
const char* is(const char* low, const char* high, mask* vec) const;
```

*Effects:* The second form, for all `*p` in the range `[low, high)`, assigns into `vec[p - low]` the value `table()[ (unsigned char)*p ]`.

*Returns:* The first form returns `table()[ (unsigned char)c ] & m`; the second form returns `high`.

```
const char* scan_is(mask m, const char* low, const char* high) const;
```

*Returns:* The smallest `p` in the range `[low, high)` such that

```
table()[ (unsigned char) *p ] & m
is true.
```

```
const char* scan_not(mask m, const char* low, const char* high) const;
```

*Returns:* The smallest `p` in the range `[low, high)` such that

```
table()[ (unsigned char) *p ] & m
is false.
```

```
char toupper(char c) const;
const char* toupper(char* low, const char* high) const;
```

*Returns:* `do_toupper(c)` or `do_toupper(low, high)`, respectively.

```
char tolower(char c) const;
const char* tolower(char* low, const char* high) const;
```

*Returns:* `do_tolower(c)` or `do_tolower(low, high)`, respectively.

```
char widen(char c) const;
const char* widen(const char* low, const char* high, char* to) const;
```

*Returns:* `do_widen(c)` or `do_widen(low, high, to)`, respectively.

```
char narrow(char c, char dfault) const;
const char* narrow(const char* low, const char* high, char dfault, char* to) const;
```

*Returns:* `do_narrow(c, dfault)` or `do_narrow(low, high, dfault, to)`, respectively.

```
const mask* table() const noexcept;
```

*Returns:* The first constructor argument, if it was nonzero, otherwise `classic_table()`.

**30.4.2.4.4 Static members****[facet.ctype.char.statics]**

```
static const mask* classic_table() noexcept;
```

*Returns:* A pointer to the initial element of an array of size `table_size` which represents the classifications of characters in the "C" locale.

**30.4.2.4.5 Virtual functions****[facet.ctype.char.virtuals]**

```
char do_toupper(char) const;
const char* do_toupper(char* low, const char* high) const;
char do_tolower(char) const;
const char* do_tolower(char* low, const char* high) const;
```

```

virtual char      do_widen(char c) const;
virtual const char* do_widen(const char* low, const char* high, char* to) const;
virtual char      do_narrow(char c, char dfault) const;
virtual const char* do_narrow(const char* low, const char* high,
                             char dfault, char* to) const;

```

These functions are described identically as those members of the same name in the `ctype` class template (30.4.2.2.2).

### 30.4.2.5 Class template `codecvt`

[locale.codecvt]

#### 30.4.2.5.1 General

[locale.codecvt.general]

```

namespace std {
    class codecvt_base {
    public:
        enum result { ok, partial, error, noconv };
    };

    template<class internT, class externT, class stateT>
    class codecvt : public locale::facet, public codecvt_base {
    public:
        using intern_type = internT;
        using extern_type = externT;
        using state_type = stateT;

        explicit codecvt(size_t refs = 0);

        result out(
            stateT& state,
            const internT* from, const internT* from_end, const internT*& from_next,
            externT* to,        externT* to_end,        externT*& to_next) const;

        result unshift(
            stateT& state,
            externT* to,        externT* to_end,        externT*& to_next) const;

        result in(
            stateT& state,
            const externT* from, const externT* from_end, const externT*& from_next,
            internT* to,        internT* to_end,        internT*& to_next) const;

        int encoding() const noexcept;
        bool always_noconv() const noexcept;
        int length(stateT&, const externT* from, const externT* end, size_t max) const;
        int max_length() const noexcept;

        static locale::id id;

    protected:
        ~codecvt();
        virtual result do_out(
            stateT& state,
            const internT* from, const internT* from_end, const internT*& from_next,
            externT* to,        externT* to_end,        externT*& to_next) const;
        virtual result do_in(
            stateT& state,
            const externT* from, const externT* from_end, const externT*& from_next,
            internT* to,        internT* to_end,        internT*& to_next) const;
        virtual result do_unshift(
            stateT& state,
            externT* to,        externT* to_end,        externT*& to_next) const;

        virtual int do_encoding() const noexcept;
        virtual bool do_always_noconv() const noexcept;
        virtual int do_length(stateT&, const externT* from, const externT* end, size_t max) const;

```

```

        virtual int do_max_length() const noexcept;
    };
}

```

The class `codecvt<internT, externT, stateT>` is for use when converting from one character encoding to another, such as from wide characters to multibyte characters or between wide character encodings such as UTF-32 and EUC.

The `stateT` argument selects the pair of character encodings being mapped between.

The specializations required in Table 104 (30.3.1.2.1) convert the implementation-defined native character set. `codecvt<char, char, mbstate_t>` implements a degenerate conversion; it does not convert at all. The specialization `codecvt<char16_t, char8_t, mbstate_t>` converts between the UTF-16 and UTF-8 encoding forms, and the specialization `codecvt<char32_t, char8_t, mbstate_t>` converts between the UTF-32 and UTF-8 encoding forms. `codecvt<wchar_t, char, mbstate_t>` converts between the native character sets for ordinary and wide characters. Specializations on `mbstate_t` perform conversion between encodings known to the library implementer. Other encodings can be converted by specializing on a program-defined `stateT` type. Objects of type `stateT` can contain any state that is useful to communicate to or from the specialized `do_in` or `do_out` members.

#### 30.4.2.5.2 Members

[locale.codecvt.members]

```

result out(
    stateT& state,
    const internT* from, const internT* from_end, const internT*& from_next,
    externT* to, externT* to_end, externT*& to_next) const;

    Returns: do_out(state, from, from_end, from_next, to, to_end, to_next).

result unshift(stateT& state, externT* to, externT* to_end, externT*& to_next) const;

    Returns: do_unshift(state, to, to_end, to_next).

result in(
    stateT& state,
    const externT* from, const externT* from_end, const externT*& from_next,
    internT* to, internT* to_end, internT*& to_next) const;

    Returns: do_in(state, from, from_end, from_next, to, to_end, to_next).

int encoding() const noexcept;

    Returns: do_encoding().

bool always_noconv() const noexcept;

    Returns: do_always_noconv().

int length(stateT& state, const externT* from, const externT* from_end, size_t max) const;

    Returns: do_length(state, from, from_end, max).

int max_length() const noexcept;

    Returns: do_max_length().

```

#### 30.4.2.5.3 Virtual functions

[locale.codecvt.virtuals]

```

result do_out(
    stateT& state,
    const internT* from, const internT* from_end, const internT*& from_next,
    externT* to, externT* to_end, externT*& to_next) const;

result do_in(
    stateT& state,
    const externT* from, const externT* from_end, const externT*& from_next,
    internT* to, internT* to_end, internT*& to_next) const;

    Preconditions: (from <= from_end && to <= to_end) is well-defined and true; state is initialized,
    if at the beginning of a sequence, or else is equal to the result of converting the preceding characters in
    the sequence.

```

*Effects:* Translates characters in the source range `[from, from_end)`, placing the results in sequential positions starting at destination `to`. Converts no more than `(from_end - from)` source elements, and stores no more than `(to_end - to)` destination elements.

Stops if it encounters a character it cannot convert. It always leaves the `from_next` and `to_next` pointers pointing one beyond the last element successfully converted. If returns `noconv`, `internT` and `externT` are the same type and the converted sequence is identical to the input sequence `[from, from_next)`. `to_next` is set equal to `to`, the value of `state` is unchanged, and there are no changes to the values in `[to, to_end)`.

A `codecvt` facet that is used by `basic_filebuf` (31.10) shall have the property that if

```
do_out(state, from, from_end, from_next, to, to_end, to_next)
```

would return `ok`, where `from != from_end`, then

```
do_out(state, from, from + 1, from_next, to, to_end, to_next)
```

shall also return `ok`, and that if

```
do_in(state, from, from_end, from_next, to, to_end, to_next)
```

would return `ok`, where `to != to_end`, then

```
do_in(state, from, from_end, from_next, to, to + 1, to_next)
```

shall also return `ok`.<sup>247</sup>

NOTE 1 As a result of operations on `state`, it can return `ok` or `partial` and set `from_next == from` and `to_next != to`.

*Returns:* An enumeration value, as summarized in Table 106.

Table 106 — `do_in/do_out` result values [tab:locale.codecvt.inout]

| Value                | Meaning                                                                                                                |
|----------------------|------------------------------------------------------------------------------------------------------------------------|
| <code>ok</code>      | completed the conversion                                                                                               |
| <code>partial</code> | not all source characters converted                                                                                    |
| <code>error</code>   | encountered a character in <code>[from, from_end)</code> that cannot be converted                                      |
| <code>noconv</code>  | <code>internT</code> and <code>externT</code> are the same type, and input sequence is identical to converted sequence |

A return value of `partial`, if `(from_next == from_end)`, indicates that either the destination sequence has not absorbed all the available destination elements, or that additional source elements are needed before another destination element can be produced.

*Remarks:* Its operations on `state` are unspecified.

NOTE 2 This argument can be used, for example, to maintain shift state, to specify conversion options (such as count only), or to identify a cache of seek offsets.

```
result do_unshift(stateT& state, externT* to, externT* to_end, externT*& to_next) const;
```

*Preconditions:* `(to <= to_end)` is well-defined and `true`; `state` is initialized, if at the beginning of a sequence, or else is equal to the result of converting the preceding characters in the sequence.

*Effects:* Places characters starting at `to` that should be appended to terminate a sequence when the current `stateT` is given by `state`.<sup>248</sup> Stores no more than `(to_end - to)` destination elements, and leaves the `to_next` pointer pointing one beyond the last element successfully stored.

*Returns:* An enumeration value, as summarized in Table 107.

<sup>247</sup>) Informally, this means that `basic_filebuf` assumes that the mappings from internal to external characters is 1 to N: that a `codecvt` facet that is used by `basic_filebuf` can translate characters one internal character at a time.

<sup>248</sup>) Typically these will be characters to return the state to `stateT()`.

Table 107 — `do_unshift` result values [tab:locale.codecvt.unshift]

| Value                | Meaning                                                                                                                                    |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| <code>ok</code>      | completed the sequence                                                                                                                     |
| <code>partial</code> | space for more than <code>to_end - to</code> destination elements was needed to terminate a sequence given the value of <code>state</code> |
| <code>error</code>   | an unspecified error has occurred                                                                                                          |
| <code>noconv</code>  | no termination is needed for this <code>state_type</code>                                                                                  |

```
int do_encoding() const noexcept;
```

*Returns:* -1 if the encoding of the `externT` sequence is state-dependent; else the constant number of `externT` characters needed to produce an internal character; or 0 if this number is not a constant.<sup>249</sup>

```
bool do_always_noconv() const noexcept;
```

*Returns:* true if `do_in()` and `do_out()` return `noconv` for all valid argument values. `codecvt<char, char, mbstate_t>` returns true.

```
int do_length(stateT& state, const externT* from, const externT* from_end, size_t max) const;
```

*Preconditions:* (`from <= from_end`) is well-defined and true; `state` is initialized, if at the beginning of a sequence, or else is equal to the result of converting the preceding characters in the sequence.

*Effects:* The effect on the `state` argument is as if it called `do_in(state, from, from_end, from, to, to+max, to)` for `to` pointing to a buffer of at least `max` elements.

*Returns:* (`from_next-from`) where `from_next` is the largest value in the range `[from, from_end]` such that the sequence of values in the range `[from, from_next)` represents `max` or fewer valid complete characters of type `internT`. The specialization `codecvt<char, char, mbstate_t>`, returns the lesser of `max` and (`from_end-from`).

```
int do_max_length() const noexcept;
```

*Returns:* The maximum value that `do_length(state, from, from_end, 1)` can return for any valid range `[from, from_end)` and `stateT` value `state`. The specialization `codecvt<char, char, mbstate_t>::do_max_length()` returns 1.

#### 30.4.2.6 Class template `codecvt_byname`

[locale.codecvt.byname]

```
namespace std {
    template<class internT, class externT, class stateT>
        class codecvt_byname : public codecvt<internT, externT, stateT> {
        public:
            explicit codecvt_byname(const char*, size_t refs = 0);
            explicit codecvt_byname(const string&, size_t refs = 0);

        protected:
            ~codecvt_byname();
        };
}
```

### 30.4.3 The numeric category

[category.numeric]

#### 30.4.3.1 General

[category.numeric.general]

The classes `num_get<>` and `num_put<>` handle numeric formatting and parsing. Virtual functions are provided for several numeric types. Implementations may (but are not required to) delegate extraction of smaller types to extractors for larger types.<sup>250</sup>

249) If `encoding()` yields -1, then more than `max_length()` `externT` elements can be consumed when producing a single `internT` character, and additional `externT` elements can appear at the end of a sequence after those that yield the final `internT` character.

250) Parsing "-1" correctly into, e.g., an `unsigned short` requires that the corresponding member `get()` at least extract the sign before delegating.

All specifications of member functions for `num_put` and `num_get` in the subclauses of 30.4.3 only apply to the specializations required in Tables 104 and 105 (30.3.1.2.1), namely `num_get<char>`, `num_get<wchar_t>`, `num_get<C, InputIterator>`, `num_put<char>`, `num_put<wchar_t>`, and `num_put<C, OutputIterator>`. These specializations refer to the `ios_base&` argument for formatting specifications (30.4), and to its imbued locale for the `num_punct<>` facet to identify all numeric punctuation preferences, and also for the `ctype<>` facet to perform character classification.

Extractor and inserter members of the standard iostreams use `num_get<>` and `num_put<>` member functions for formatting and parsing numeric values (31.7.5.3.1, 31.7.6.3.1).

### 30.4.3.2 Class template `num_get`

[locale.num.get]

#### 30.4.3.2.1 General

[locale.num.get.general]

```
namespace std {
    template<class charT, class InputIterator = istreambuf_iterator<charT>>
        class num_get : public locale::facet {
        public:
            using char_type = charT;
            using iter_type = InputIterator;

            explicit num_get(size_t refs = 0);

            iter_type get(iter_type in, iter_type end, ios_base&,
                          ios_base::iostate& err, bool& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
                          ios_base::iostate& err, long& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
                          ios_base::iostate& err, long long& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
                          ios_base::iostate& err, unsigned short& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
                          ios_base::iostate& err, unsigned int& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
                          ios_base::iostate& err, unsigned long& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
                          ios_base::iostate& err, unsigned long long& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
                          ios_base::iostate& err, float& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
                          ios_base::iostate& err, double& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
                          ios_base::iostate& err, long double& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
                          ios_base::iostate& err, void*& v) const;

            static locale::id id;

        protected:
            ~num_get();
            virtual iter_type do_get(iter_type, iter_type, ios_base&,
                                     ios_base::iostate& err, bool& v) const;
            virtual iter_type do_get(iter_type, iter_type, ios_base&,
                                     ios_base::iostate& err, long& v) const;
            virtual iter_type do_get(iter_type, iter_type, ios_base&,
                                     ios_base::iostate& err, long long& v) const;
            virtual iter_type do_get(iter_type, iter_type, ios_base&,
                                     ios_base::iostate& err, unsigned short& v) const;
            virtual iter_type do_get(iter_type, iter_type, ios_base&,
                                     ios_base::iostate& err, unsigned int& v) const;
            virtual iter_type do_get(iter_type, iter_type, ios_base&,
                                     ios_base::iostate& err, unsigned long& v) const;
            virtual iter_type do_get(iter_type, iter_type, ios_base&,
                                     ios_base::iostate& err, unsigned long long& v) const;
        };
}
```

```

    virtual iter_type do_get(iter_type, iter_type, ios_base&,
                            ios_base::iostate& err, float& v) const;
    virtual iter_type do_get(iter_type, iter_type, ios_base&,
                            ios_base::iostate& err, double& v) const;
    virtual iter_type do_get(iter_type, iter_type, ios_base&,
                            ios_base::iostate& err, long double& v) const;
    virtual iter_type do_get(iter_type, iter_type, ios_base&,
                            ios_base::iostate& err, void*& v) const;
};
}

```

The facet `num_get` is used to parse numeric values from an input sequence such as an istream.

#### 30.4.3.2.2 Members

[facet.num.get.members]

```

iter_type get(iter_type in, iter_type end, ios_base& str,
              ios_base::iostate& err, bool& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
              ios_base::iostate& err, long& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
              ios_base::iostate& err, long long& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
              ios_base::iostate& err, unsigned short& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
              ios_base::iostate& err, unsigned int& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
              ios_base::iostate& err, unsigned long& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
              ios_base::iostate& err, unsigned long long& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
              ios_base::iostate& err, float& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
              ios_base::iostate& err, double& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
              ios_base::iostate& err, long double& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
              ios_base::iostate& err, void*& val) const;

```

*Returns:* `do_get(in, end, str, err, val)`.

#### 30.4.3.2.3 Virtual functions

[facet.num.get.virtuals]

```

iter_type do_get(iter_type in, iter_type end, ios_base& str,
                 ios_base::iostate& err, long& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                 ios_base::iostate& err, long long& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                 ios_base::iostate& err, unsigned short& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                 ios_base::iostate& err, unsigned int& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                 ios_base::iostate& err, unsigned long& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                 ios_base::iostate& err, unsigned long long& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                 ios_base::iostate& err, float& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                 ios_base::iostate& err, double& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                 ios_base::iostate& err, long double& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                 ios_base::iostate& err, void*& val) const;

```

*Effects:* Reads characters from `in`, interpreting them according to `str.flags()`, `use_facet<ctype<charT>>(loc)`, and `use_facet<numeric<charT>>(loc)`, where `loc` is `str.getloc()`.

The details of this operation occur in three stages:

- Stage 1: Determine a conversion specifier.
- Stage 2: Extract characters from `in` and determine a corresponding `char` value for the format expected by the conversion specification determined in stage 1.
- Stage 3: Store results.

The details of the stages are presented below.

Stage 1: The function initializes local variables via

```
fmtflags flags = str.flags();
fmtflags basefield = (flags & ios_base::basefield);
fmtflags uppercase = (flags & ios_base::uppercase);
fmtflags boolalpha = (flags & ios_base::boolalpha);
```

For conversion to an integral type, the function determines the integral conversion specifier as indicated in Table 108. The table is ordered. That is, the first line whose condition is true applies.

**Table 108 — Integer conversions** [tab:facet.num.get.int]

| State                         | stdio equivalent |
|-------------------------------|------------------|
| <code>basefield == oct</code> | <code>%o</code>  |
| <code>basefield == hex</code> | <code>%X</code>  |
| <code>basefield == 0</code>   | <code>%i</code>  |
| signed integral type          | <code>%d</code>  |
| unsigned integral type        | <code>%u</code>  |

For conversions to a floating-point type the specifier is `%g`.

For conversions to `void*` the specifier is `%p`.

A length modifier is added to the conversion specification, if needed, as indicated in Table 109.

**Table 109 — Length modifier** [tab:facet.num.get.length]

| Type                            | Length modifier |
|---------------------------------|-----------------|
| <code>short</code>              | <code>h</code>  |
| <code>unsigned short</code>     | <code>h</code>  |
| <code>long</code>               | <code>l</code>  |
| <code>unsigned long</code>      | <code>l</code>  |
| <code>long long</code>          | <code>ll</code> |
| <code>unsigned long long</code> | <code>ll</code> |
| <code>double</code>             | <code>l</code>  |
| <code>long double</code>        | <code>L</code>  |

Stage 2: If `in == end` then stage 2 terminates. Otherwise a `charT` is taken from `in` and local variables are initialized as if by

```
char_type ct = *in;
char c = src[find(atoms, atoms + sizeof(src) - 1, ct) - atoms];
if (ct == use_facet<num_punct<charT>>(loc).decimal_point())
    c = '.';
bool discard =
    ct == use_facet<num_punct<charT>>(loc).thousands_sep()
    && use_facet<num_punct<charT>>(loc).grouping().length() != 0;
```

where the values `src` and `atoms` are defined as if by:

```
static const char src[] = "0123456789abcdefghijklmnopqrstuvwxyz+-";
char_type atoms[sizeof(src)];
use_facet<ctype<charT>>(loc).widen(src, src + sizeof(src), atoms);
```

for this value of `loc`.

If `discard` is `true`, then if `'.'` has not yet been accumulated, then the position of the character is remembered, but the character is otherwise ignored. Otherwise, if `'.'` has already been accumulated, the character is discarded and Stage 2 terminates. If it is not discarded, then a

check is made to determine if `c` is allowed as the next character of an input field of the conversion specifier returned by Stage 1. If so, it is accumulated.

If the character is either discarded or accumulated then `in` is advanced by `++in` and processing returns to the beginning of stage 2.

EXAMPLE 1 Given an input sequence of `"0x1a.bp+07p"`,

- if the conversion specifier returned by Stage 1 is `%d`, `"0"` is accumulated;
- if the conversion specifier returned by Stage 1 is `%i`, `"0x1a"` are accumulated;
- if the conversion specifier returned by Stage 1 is `%g`, `"0x1a.bp+07"` are accumulated.

In all cases, the remainder is left in the input.

Stage 3: The sequence of `chars` accumulated in stage 2 (the field) is converted to a numeric value by the rules of one of the functions declared in the header `<cstdlib>`:

- For a signed integer value, the function `strtoll`.
- For an unsigned integer value, the function `strtoull`.
- For a float value, the function `strtof`.
- For a double value, the function `strtod`.
- For a long double value, the function `strtold`.

The numeric value to be stored can be one of:

- zero, if the conversion function does not convert the entire field.
- the most positive (or negative) representable value, if the field to be converted to a signed integer type represents a value too large positive (or negative) to be represented in `val`.
- the most positive representable value, if the field to be converted to an unsigned integer type represents a value that cannot be represented in `val`.
- the converted value, otherwise.

The resultant numeric value is stored in `val`. If the conversion function does not convert the entire field, or if the field represents a value outside the range of representable values, `ios_base::failbit` is assigned to `err`.

Digit grouping is checked. That is, the positions of discarded separators are examined for consistency with `use_facet<num_punct<charT>>(loc).grouping()`. If they are not consistent then `ios_base::failbit` is assigned to `err`.

In any case, if stage 2 processing was terminated by the test for `in == end` then `err |= ios_base::eofbit` is performed.

```
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                ios_base::iostate& err, bool& val) const;
```

*Effects:* If `(str.flags() & ios_base::boolalpha) == 0` then input proceeds as it would for a long except that if a value is being stored into `val`, the value is determined according to the following: If the value to be stored is 0 then `false` is stored. If the value is 1 then `true` is stored. Otherwise `true` is stored and `ios_base::failbit` is assigned to `err`.

Otherwise target sequences are determined “as if” by calling the members `false_name()` and `true_name()` of the facet obtained by `use_facet<num_punct<charT>>(str.getloc())`. Successive characters in the range `[in, end)` (see 24.2.4) are obtained and matched against corresponding positions in the target sequences only as necessary to identify a unique match. The input iterator `in` is compared to `end` only when necessary to obtain a character. If a target sequence is uniquely matched, `val` is set to the corresponding value. Otherwise `false` is stored and `ios_base::failbit` is assigned to `err`.

The `in` iterator is always left pointing one position beyond the last character successfully matched. If `val` is set, then `err` is set to `str.goodbit`; or to `str.eofbit` if, when seeking another character to match, it is found that `(in == end)`. If `val` is not set, then `err` is set to `str.failbit`; or to `(str.failbit | str.eofbit)` if the reason for the failure was that `(in == end)`.

EXAMPLE 2 For targets `true: "a"` and `false: "abb"`, the input sequence `"a"` yields `val == true` and `err == str.eofbit`; the input sequence `"abc"` yields `err = str.failbit`, with `in` ending at the `'c'` element. For targets `true: "1"` and `false: "0"`, the input sequence `"1"` yields `val == true` and `err == str.goodbit`. For empty targets `( "")`, any input sequence yields `err == str.failbit`.

*Returns:* `in`.

**30.4.3.3 Class template num\_put**

[locale.num.put]

**30.4.3.3.1 General**

[locale.num.put.general]

```

namespace std {
    template<class charT, class OutputIterator = ostreambuf_iterator<charT>>
        class num_put : public locale::facet {
        public:
            using char_type = charT;
            using iter_type = OutputIterator;

            explicit num_put(size_t refs = 0);

            iter_type put(iter_type s, ios_base& f, char_type fill, bool v) const;
            iter_type put(iter_type s, ios_base& f, char_type fill, long v) const;
            iter_type put(iter_type s, ios_base& f, char_type fill, long long v) const;
            iter_type put(iter_type s, ios_base& f, char_type fill, unsigned long v) const;
            iter_type put(iter_type s, ios_base& f, char_type fill, unsigned long long v) const;
            iter_type put(iter_type s, ios_base& f, char_type fill, double v) const;
            iter_type put(iter_type s, ios_base& f, char_type fill, long double v) const;
            iter_type put(iter_type s, ios_base& f, char_type fill, const void* v) const;

            static locale::id id;

        protected:
            ~num_put();
            virtual iter_type do_put(iter_type, ios_base&, char_type fill, bool v) const;
            virtual iter_type do_put(iter_type, ios_base&, char_type fill, long v) const;
            virtual iter_type do_put(iter_type, ios_base&, char_type fill, long long v) const;
            virtual iter_type do_put(iter_type, ios_base&, char_type fill, unsigned long) const;
            virtual iter_type do_put(iter_type, ios_base&, char_type fill, unsigned long long) const;
            virtual iter_type do_put(iter_type, ios_base&, char_type fill, double v) const;
            virtual iter_type do_put(iter_type, ios_base&, char_type fill, long double v) const;
            virtual iter_type do_put(iter_type, ios_base&, char_type fill, const void* v) const;
        };
    }

```

The facet `num_put` is used to format numeric values to a character sequence such as an ostream.

**30.4.3.3.2 Members**

[facet.num.put.members]

```

iter_type put(iter_type out, ios_base& str, char_type fill, bool val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, long val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, long long val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, unsigned long val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, unsigned long long val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, double val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, long double val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, const void* val) const;

```

*Returns:* `do_put(out, str, fill, val)`.

**30.4.3.3.3 Virtual functions**

[facet.num.put.virtuals]

```

iter_type do_put(iter_type out, ios_base& str, char_type fill, long val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill, long long val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill, unsigned long val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill, unsigned long long val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill, double val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill, long double val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill, const void* val) const;

```

*Effects:* Writes characters to the sequence `out`, formatting `val` as desired. In the following description, `loc` names a local variable initialized as

```
locale loc = str.getloc();
```

The details of this operation occur in several stages:

- Stage 1: Determine a printf conversion specifier **spec** and determine the characters that would be printed by **printf** (31.13) given this conversion specifier for  

```
printf(spec, val)
```

assuming that the current locale is the "C" locale.
- Stage 2: Adjust the representation by converting each **char** determined by stage 1 to a **charT** using a conversion and values returned by members of **use\_facet<num\_punct<charT>>(loc)**.
- Stage 3: Determine where padding is required.
- Stage 4: Insert the sequence into the **out**.

Detailed descriptions of each stage follow.

*Returns:* **out**.

Stage 1: The first action of stage 1 is to determine a conversion specifier. The tables that describe this determination use the following local variables

```
fmtflags flags = str.flags();
fmtflags basefield = (flags & (ios_base::basefield));
fmtflags uppercase = (flags & (ios_base::uppercase));
fmtflags floatfield = (flags & (ios_base::floatfield));
fmtflags showpos = (flags & (ios_base::showpos));
fmtflags showbase = (flags & (ios_base::showbase));
fmtflags showpoint = (flags & (ios_base::showpoint));
```

All tables used in describing stage 1 are ordered. That is, the first line whose condition is true applies. A line without a condition is the default behavior when none of the earlier lines apply.

For conversion from an integral type other than a character type, the function determines the integral conversion specifier as indicated in Table 110.

**Table 110 — Integer conversions** [tab:facet.num.put.int]

| State                                                           | stdio equivalent |
|-----------------------------------------------------------------|------------------|
| <code>basefield == ios_base::oct</code>                         | <code>%o</code>  |
| <code>(basefield == ios_base::hex) &amp;&amp; !uppercase</code> | <code>%x</code>  |
| <code>(basefield == ios_base::hex)</code>                       | <code>%X</code>  |
| for a signed integral type                                      | <code>%d</code>  |
| for an unsigned integral type                                   | <code>%u</code>  |

For conversion from a floating-point type, the function determines the floating-point conversion specifier as indicated in Table 111.

**Table 111 — Floating-point conversions** [tab:facet.num.put.fp]

| State                                                                                     | stdio equivalent |
|-------------------------------------------------------------------------------------------|------------------|
| <code>floatfield == ios_base::fixed</code>                                                | <code>%f</code>  |
| <code>floatfield == ios_base::scientific &amp;&amp; !uppercase</code>                     | <code>%e</code>  |
| <code>floatfield == ios_base::scientific</code>                                           | <code>%E</code>  |
| <code>floatfield == (ios_base::fixed   ios_base::scientific) &amp;&amp; !uppercase</code> | <code>%a</code>  |
| <code>floatfield == (ios_base::fixed   ios_base::scientific)</code>                       | <code>%A</code>  |
| <code>!uppercase</code>                                                                   | <code>%g</code>  |
| <i>otherwise</i>                                                                          | <code>%G</code>  |

For conversions from an integral or floating-point type a length modifier is added to the conversion specifier as indicated in Table 112.

The conversion specifier has the following optional additional qualifiers prepended as indicated in Table 113.

For conversion from a floating-point type, if `floatfield != (ios_base::fixed | ios_base::scientific)`, `str.precision()` is specified as precision in the conversion specification. Otherwise, no precision is specified.

Table 112 — Length modifier [tab:facet.num.put.length]

| Type               | Length modifier |
|--------------------|-----------------|
| long               | l               |
| long long          | ll              |
| unsigned long      | l               |
| unsigned long long | ll              |
| long double        | L               |
| <i>otherwise</i>   | <i>none</i>     |

Table 113 — Numeric conversions [tab:facet.num.put.conv]

| Type(s)               | State     | stdio equivalent |
|-----------------------|-----------|------------------|
| an integral type      | showpos   | +                |
|                       | showbase  | #                |
| a floating-point type | showpos   | +                |
|                       | showpoint | #                |

For conversion from `void*` the specifier is `%p`.

The representations at the end of stage 1 consists of the `char`'s that would be printed by a call of `printf(s, val)` where `s` is the conversion specifier determined above.

Stage 2: Any character `c` other than a decimal point(`.`) is converted to a `charT` via

```
use_facet<ctype<charT>>(loc).widen(c)
```

A local variable `punct` is initialized via

```
const numpunct<charT>& punct = use_facet<numpunct<charT>>(loc);
```

For arithmetic types, `punct.thousands_sep()` characters are inserted into the sequence as determined by the value returned by `punct.do_grouping()` using the method described in 30.4.4.1.3.

Decimal point characters(`.`) are replaced by `punct.decimal_point()`.

Stage 3: A local variable is initialized as

```
fmtflags adjustfield = (flags & (ios_base::adjustfield));
```

The location of any padding<sup>251</sup> is determined according to Table 114.

Table 114 — Fill padding [tab:facet.num.put.fill]

| State                                                                                                               | Location                                   |
|---------------------------------------------------------------------------------------------------------------------|--------------------------------------------|
| <code>adjustfield == ios_base::left</code>                                                                          | pad after                                  |
| <code>adjustfield == ios_base::right</code>                                                                         | pad before                                 |
| <code>adjustfield == internal</code> and a sign occurs in the representation                                        | pad after the sign                         |
| <code>adjustfield == internal</code> and representation after stage 1 began with <code>0x</code> or <code>0X</code> | pad after <code>x</code> or <code>X</code> |
| <i>otherwise</i>                                                                                                    | pad before                                 |

If `str.width()` is nonzero and the number of `charT`'s in the sequence after stage 2 is less than `str.width()`, then enough fill characters are added to the sequence at the position indicated for padding to bring the length of the sequence to `str.width()`.

`str.width(0)` is called.

Stage 4: The sequence of `charT`'s at the end of stage 3 are output via

```
*out++ = c
```

<sup>251</sup>) The conversion specification `#o` generates a leading 0 which is *not* a padding character.

```
iter_type do_put(iter_type out, ios_base& str, char_type fill, bool val) const;
```

*Returns:* If `(str.flags() & ios_base::boolalpha) == 0` returns `do_put(out, str, fill, (int)val)`, otherwise obtains a string `s` as if by

```
string_type s =
    val ? use_facet<num_punct<charT>>(loc).truename()
        : use_facet<num_punct<charT>>(loc).falsename();
```

and then inserts each character `c` of `s` into `out` via `*out++ = c` and returns `out`.

### 30.4.4 The numeric punctuation facet

[facet.num\_punct]

#### 30.4.4.1 Class template num\_punct

[locale.num\_punct]

##### 30.4.4.1.1 General

[locale.num\_punct.general]

```
namespace std {
    template<class charT>
    class num_punct : public locale::facet {
    public:
        using char_type = charT;
        using string_type = basic_string<charT>;

        explicit num_punct(size_t refs = 0);

        char_type decimal_point() const;
        char_type thousands_sep() const;
        string grouping() const;
        string_type truename() const;
        string_type falsename() const;

        static locale::id id;

    protected:
        ~num_punct(); // virtual
        virtual char_type do_decimal_point() const;
        virtual char_type do_thousands_sep() const;
        virtual string do_grouping() const;
        virtual string_type do_truename() const; // for bool
        virtual string_type do_falsename() const; // for bool
    };
}
```

`num_punct<>` specifies numeric punctuation. The specializations required in Table 104 (30.3.1.2.1), namely `num_punct<wchar_t>` and `num_punct<char>`, provide classic "C" numeric formats, i.e., they contain information equivalent to that contained in the "C" locale or their wide character counterparts as if obtained by a call to `widen`.

The syntax for number formats is as follows, where *digit* represents the radix set specified by the `fmtflags` argument value, and *thousands-sep* and *decimal-point* are the results of corresponding `num_punct<charT>` members. Integer values have the format:

```
intval:
    signopt units

sign:
    +
    -

units:
    digits
    digits thousands-sep units

digits:
    digit digitsopt
```

and floating-point values have:

```
floatval:
    signopt units fractionalopt exponentopt
    signopt decimal-point digits exponentopt
```

```
fractional:
    decimal-point digitsopt
exponent:
    e signopt digits
e:
    e
    E
```

where the number of digits between *thousands-seps* is as specified by `do_grouping()`. For parsing, if the *digits* portion contains no thousands-separators, no grouping constraint is applied.

#### 30.4.4.1.2 Members

[facet.numpunct.members]

```
char_type decimal_point() const;
```

*Returns:* `do_decimal_point()`.

```
char_type thousands_sep() const;
```

*Returns:* `do_thousands_sep()`.

```
string grouping() const;
```

*Returns:* `do_grouping()`.

```
string_type truenamename() const;
```

```
string_type falsenamename() const;
```

*Returns:* `do_truenamename()` or `do_falsenamename()`, respectively.

#### 30.4.4.1.3 Virtual functions

[facet.numpunct.virtuals]

```
char_type do_decimal_point() const;
```

*Returns:* A character for use as the decimal radix separator. The required specializations return `'.'` or `L'.'`.

```
char_type do_thousands_sep() const;
```

*Returns:* A character for use as the digit group separator. The required specializations return `','` or `L','`.

```
string do_grouping() const;
```

*Returns:* A `string` `vec` used as a vector of integer values, in which each element `vec[i]` represents the number of digits<sup>252</sup> in the group at position `i`, starting with position 0 as the rightmost group. If `vec.size() <= i`, the number is the same as group `(i - 1)`; if `(i < 0 || vec[i] <= 0 || vec[i] == CHAR_MAX)`, the size of the digit group is unlimited.

The required specializations return the empty string, indicating no grouping.

```
string_type do_truenamename() const;
```

```
string_type do_falsenamename() const;
```

*Returns:* A string representing the name of the boolean value `true` or `false`, respectively.

In the base class implementation these names are `"true"` and `"false"`, or `L"true"` and `L"false"`.

#### 30.4.4.2 Class template `numpunct_byname`

[locale.numpunct.bynamename]

```
namespace std {
    template<class charT>
        class numpunct_byname : public numpunct<charT> {
            // this class is specialized for char and wchar_t.
        public:
            using char_type = charT;
            using string_type = basic_string<charT>;
```

<sup>252</sup>) Thus, the string `"\003"` specifies groups of 3 digits each, and `"3"` probably indicates groups of 51 (!) digits each, because 51 is the ASCII value of `"3"`.

```

explicit numpunct_byname(const char*, size_t refs = 0);
explicit numpunct_byname(const string&, size_t refs = 0);

protected:
    ~numpunct_byname();
};
}

```

### 30.4.5 The collate category

[category.collate]

#### 30.4.5.1 Class template collate

[locale.collate]

##### 30.4.5.1.1 General

[locale.collate.general]

```

namespace std {
    template<class charT>
        class collate : public locale::facet {
        public:
            using char_type    = charT;
            using string_type = basic_string<charT>;

            explicit collate(size_t refs = 0);

            int compare(const charT* low1, const charT* high1,
                       const charT* low2, const charT* high2) const;
            string_type transform(const charT* low, const charT* high) const;
            long hash(const charT* low, const charT* high) const;

            static locale::id id;

        protected:
            ~collate();
            virtual int do_compare(const charT* low1, const charT* high1,
                                  const charT* low2, const charT* high2) const;
            virtual string_type do_transform(const charT* low, const charT* high) const;
            virtual long do_hash (const charT* low, const charT* high) const;
        };
}

```

The class `collate<charT>` provides features for use in the collation (comparison) and hashing of strings. A locale member function template, `operator()`, uses the collate facet to allow a locale to act directly as the predicate argument for standard algorithms (Clause 27) and containers operating on strings. The specializations required in Table 104 (30.3.1.2.1), namely `collate<char>` and `collate<wchar_t>`, apply lexicographical ordering (27.8.11).

Each function compares a string of characters `*p` in the range `[low, high)`.

##### 30.4.5.1.2 Members

[locale.collate.members]

```

int compare(const charT* low1, const charT* high1,
            const charT* low2, const charT* high2) const;

    Returns: do_compare(low1, high1, low2, high2).

string_type transform(const charT* low, const charT* high) const;

    Returns: do_transform(low, high).

long hash(const charT* low, const charT* high) const;

    Returns: do_hash(low, high).

```

##### 30.4.5.1.3 Virtual functions

[locale.collate.virtuals]

```

int do_compare(const charT* low1, const charT* high1,
               const charT* low2, const charT* high2) const;

    Returns: 1 if the first string is greater than the second, -1 if less, zero otherwise. The specializations
    required in Table 104 (30.3.1.2.1), namely collate<char> and collate<wchar_t>, implement a
    lexicographical comparison (27.8.11).

```

```
string_type do_transform(const charT* low, const charT* high) const;
```

*Returns:* A `basic_string<charT>` value that, compared lexicographically with the result of calling `transform()` on another string, yields the same result as calling `do_compare()` on the same two strings.<sup>253</sup>

```
long do_hash(const charT* low, const charT* high) const;
```

*Returns:* An integer value equal to the result of calling `hash()` on any other string for which `do_compare()` returns 0 (equal) when passed the two strings.

Recommended practice: The probability that the result equals that for another string which does not compare equal should be very small, approaching  $(1.0/\text{numeric\_limits}<\text{unsigned long}>::\text{max}())$ .

### 30.4.5.2 Class template `collate_byname`

[`locale.collate.byname`]

```
namespace std {
    template<class charT>
    class collate_byname : public collate<charT> {
    public:
        using string_type = basic_string<charT>;

        explicit collate_byname(const char*, size_t refs = 0);
        explicit collate_byname(const string&, size_t refs = 0);

    protected:
        ~collate_byname();
    };
}
```

## 30.4.6 The time category

[`category.time`]

### 30.4.6.1 General

[`category.time.general`]

Templates `time_get<charT, InputIterator>` and `time_put<charT, OutputIterator>` provide date and time formatting and parsing. All specifications of member functions for `time_put` and `time_get` in the subclauses of 30.4.6 only apply to the specializations required in Tables 104 and 105 (30.3.1.2.1). Their members use their `ios_base&`, `ios_base::iostate&`, and fill arguments as described in 30.4, and the `ctype<>` facet, to determine formatting details.

### 30.4.6.2 Class template `time_get`

[`locale.time.get`]

#### 30.4.6.2.1 General

[`locale.time.get.general`]

```
namespace std {
    class time_base {
    public:
        enum dateorder { no_order, dmy, mdy, ymd, ydm };
    };

    template<class charT, class InputIterator = istreambuf_iterator<charT>>
    class time_get : public locale::facet, public time_base {
    public:
        using char_type = charT;
        using iter_type = InputIterator;

        explicit time_get(size_t refs = 0);

        dateorder date_order() const { return do_date_order(); }
        iter_type get_time(iter_type s, iter_type end, ios_base& f,
                          ios_base::iostate& err, tm* t) const;
        iter_type get_date(iter_type s, iter_type end, ios_base& f,
                          ios_base::iostate& err, tm* t) const;
        iter_type get_weekday(iter_type s, iter_type end, ios_base& f,
                              ios_base::iostate& err, tm* t) const;
        iter_type get_monthname(iter_type s, iter_type end, ios_base& f,
                               ios_base::iostate& err, tm* t) const;
    };
}
```

<sup>253</sup>) This function is useful when one string is being compared to many other strings.

```

iter_type get_year(iter_type s, iter_type end, ios_base& f,
                  ios_base::iostate& err, tm* t) const;
iter_type get(iter_type s, iter_type end, ios_base& f,
              ios_base::iostate& err, tm* t, char format, char modifier = 0) const;
iter_type get(iter_type s, iter_type end, ios_base& f,
              ios_base::iostate& err, tm* t, const char_type* fmt,
              const char_type* fmtend) const;

static locale::id id;

protected:
    ~time_get();
    virtual dateorder do_date_order() const;
    virtual iter_type do_get_time(iter_type s, iter_type end, ios_base& f,
                                ios_base::iostate& err, tm* t) const;
    virtual iter_type do_get_date(iter_type s, iter_type end, ios_base& f,
                                ios_base::iostate& err, tm* t) const;
    virtual iter_type do_get_weekday(iter_type s, iter_type end, ios_base& f,
                                    ios_base::iostate& err, tm* t) const;
    virtual iter_type do_get_monthname(iter_type s, iter_type end, ios_base& f,
                                      ios_base::iostate& err, tm* t) const;
    virtual iter_type do_get_year(iter_type s, iter_type end, ios_base& f,
                                  ios_base::iostate& err, tm* t) const;
    virtual iter_type do_get(iter_type s, iter_type end, ios_base& f,
                             ios_base::iostate& err, tm* t, char format, char modifier) const;
};
}

```

`time_get` is used to parse a character sequence, extracting components of a time or date into a `tm` object. Each `get` member parses a format as produced by a corresponding format specifier to `time_put<>::put`. If the sequence being parsed matches the correct format, the corresponding members of the `tm` argument are set to the values used to produce the sequence; otherwise either an error is reported or unspecified values are assigned.<sup>254</sup>

If the end iterator is reached during parsing by any of the `get()` member functions, the member sets `ios_base::eofbit` in `err`.

#### 30.4.6.2.2 Members

[`locale.time.get.members`]

```
dateorder date_order() const;
```

*Returns:* `do_date_order()`.

```
iter_type get_time(iter_type s, iter_type end, ios_base& str,
                  ios_base::iostate& err, tm* t) const;
```

*Returns:* `do_get_time(s, end, str, err, t)`.

```
iter_type get_date(iter_type s, iter_type end, ios_base& str,
                  ios_base::iostate& err, tm* t) const;
```

*Returns:* `do_get_date(s, end, str, err, t)`.

```
iter_type get_weekday(iter_type s, iter_type end, ios_base& str,
                     ios_base::iostate& err, tm* t) const;
```

```
iter_type get_monthname(iter_type s, iter_type end, ios_base& str,
                       ios_base::iostate& err, tm* t) const;
```

*Returns:* `do_get_weekday(s, end, str, err, t)` or `do_get_monthname(s, end, str, err, t)`.

```
iter_type get_year(iter_type s, iter_type end, ios_base& str,
                  ios_base::iostate& err, tm* t) const;
```

*Returns:* `do_get_year(s, end, str, err, t)`.

<sup>254</sup>) In other words, user confirmation is required for reliable parsing of user-entered dates and times, but machine-generated formats can be parsed reliably. This allows parsers to be aggressive about interpreting user variations on standard formats.

```
iter_type get(iter_type s, iter_type end, ios_base& f, ios_base::iostate& err,
             tm* t, char format, char modifier = 0) const;
```

*Returns:* `do_get(s, end, f, err, t, format, modifier)`.

```
iter_type get(iter_type s, iter_type end, ios_base& f, ios_base::iostate& err,
             tm* t, const char_type* fmt, const char_type* fmtend) const;
```

*Preconditions:* `[fmt,fmtend)` is a valid range.

*Effects:* The function starts by evaluating `err = ios_base::goodbit`. It then enters a loop, reading zero or more characters from `s` at each iteration. Unless otherwise specified below, the loop terminates when the first of the following conditions holds:

- The expression `fmt == fmtend` evaluates to `true`.
- The expression `err == ios_base::goodbit` evaluates to `false`.
- The expression `s == end` evaluates to `true`, in which case the function evaluates `err = ios_base::eofbit | ios_base::failbit`.
- The next element of `fmt` is equal to `'%'`, optionally followed by a modifier character, followed by a conversion specifier character, `format`, together forming a conversion specification valid for the POSIX function `strptime`. If the number of elements in the range `[fmt,fmtend)` is not sufficient to unambiguously determine whether the conversion specification is complete and valid, the function evaluates `err = ios_base::failbit`. Otherwise, the function evaluates `s = do_get(s, end, f, err, t, format, modifier)`, where the value of `modifier` is `'\0'` when the optional modifier is absent from the conversion specification. If `err == ios_base::goodbit` holds after the evaluation of the expression, the function increments `fmt` to point just past the end of the conversion specification and continues looping.
- The expression `isspace(*fmt, f.getloc())` evaluates to `true`, in which case the function first increments `fmt` until `fmt == fmtend || !isspace(*fmt, f.getloc())` evaluates to `true`, then advances `s` until `s == end || !isspace(*s, f.getloc())` is `true`, and finally resumes looping.
- The next character read from `s` matches the element pointed to by `fmt` in a case-insensitive comparison, in which case the function evaluates `++fmt, ++s` and continues looping. Otherwise, the function evaluates `err = ios_base::failbit`.

NOTE The function uses the `ctype<charT>` facet installed in `f`'s locale to determine valid whitespace characters. It is unspecified by what means the function performs case-insensitive comparison or whether multi-character sequences are considered while doing so.

*Returns:* `s`.

#### 30.4.6.2.3 Virtual functions [locale.time.get.virtuals]

```
dateorder do_date_order() const;
```

*Returns:* An enumeration value indicating the preferred order of components for those date formats that are composed of day, month, and year.<sup>255</sup> Returns `no_order` if the date format specified by `'x'` contains other variable components (e.g., Julian day, week number, week day).

```
iter_type do_get_time(iter_type s, iter_type end, ios_base& str,
                    ios_base::iostate& err, tm* t) const;
```

*Effects:* Reads characters starting at `s` until it has extracted those `tm` members, and remaining format characters, used by `time_put<>::put` to produce the format specified by `"%H:%M:%S"`, or until it encounters an error or end of sequence.

*Returns:* An iterator pointing immediately beyond the last character recognized as possibly part of a valid time.

```
iter_type do_get_date(iter_type s, iter_type end, ios_base& str,
                    ios_base::iostate& err, tm* t) const;
```

*Effects:* Reads characters starting at `s` until it has extracted those `tm` members and remaining format characters used by `time_put<>::put` to produce one of the following formats, or until it encounters an error. The format depends on the value returned by `date_order()` as shown in Table 115.

<sup>255</sup>) This function is intended as a convenience only, for common formats, and can return `no_order` in valid locales.

Table 115 — `do_get_date` effects [tab:locale.time.get.dogetdate]

| <code>date_order()</code> | Format   |
|---------------------------|----------|
| <code>no_order</code>     | "%m%d%y" |
| <code>dmy</code>          | "%d%m%y" |
| <code>mdy</code>          | "%m%d%y" |
| <code>ymd</code>          | "%y%m%d" |
| <code>ydm</code>          | "%y%d%m" |

An implementation may also accept additional implementation-defined formats.

*Returns:* An iterator pointing immediately beyond the last character recognized as possibly part of a valid date.

```
iter_type do_get_weekday(iter_type s, iter_type end, ios_base& str,
                        ios_base::iostate& err, tm* t) const;
iter_type do_get_monthname(iter_type s, iter_type end, ios_base& str,
                          ios_base::iostate& err, tm* t) const;
```

*Effects:* Reads characters starting at `s` until it has extracted the (perhaps abbreviated) name of a weekday or month. If it finds an abbreviation that is followed by characters that can match a full name, it continues reading until it matches the full name or fails. It sets the appropriate `tm` member accordingly.

*Returns:* An iterator pointing immediately beyond the last character recognized as part of a valid name.

```
iter_type do_get_year(iter_type s, iter_type end, ios_base& str,
                    ios_base::iostate& err, tm* t) const;
```

*Effects:* Reads characters starting at `s` until it has extracted an unambiguous year identifier. It is implementation-defined whether two-digit year numbers are accepted, and (if so) what century they are assumed to lie in. Sets the `t->tm_year` member accordingly.

*Returns:* An iterator pointing immediately beyond the last character recognized as part of a valid year identifier.

```
iter_type do_get(iter_type s, iter_type end, ios_base& f,
                ios_base::iostate& err, tm* t, char format, char modifier) const;
```

*Preconditions:* `t` points to an object.

*Effects:* The function starts by evaluating `err = ios_base::goodbit`. It then reads characters starting at `s` until it encounters an error, or until it has extracted and assigned those `tm` members, and any remaining format characters, corresponding to a conversion specification appropriate for the POSIX function `strptime`, formed by concatenating `'%'`, the `modifier` character, when non-NUL, and the `format` character. When the concatenation fails to yield a complete valid directive the function leaves the object pointed to by `t` unchanged and evaluates `err |= ios_base::failbit`. When `s == end` evaluates to `true` after reading a character the function evaluates `err |= ios_base::eofbit`.

For complex conversion specifications such as `%c`, `%x`, or `%X`, or conversion specifications that involve the optional modifiers `E` or `O`, when the function is unable to unambiguously determine some or all `tm` members from the input sequence `[s, end)`, it evaluates `err |= ios_base::eofbit`. In such cases the values of those `tm` members are unspecified and may be outside their valid range.

*Returns:* An iterator pointing immediately beyond the last character recognized as possibly part of a valid input sequence for the given `format` and `modifier`.

*Remarks:* It is unspecified whether multiple calls to `do_get()` with the address of the same `tm` object will update the current contents of the object or simply overwrite its members. Portable programs should zero out the object before invoking the function.

30.4.6.3 Class template `time_get_byname`[`locale.time.get.byname`]

```

namespace std {
    template<class charT, class InputIterator = istreambuf_iterator<charT>>
        class time_get_byname : public time_get<charT, InputIterator> {
        public:
            using dateorder = time_base::dateorder;
            using iter_type = InputIterator;

            explicit time_get_byname(const char*, size_t refs = 0);
            explicit time_get_byname(const string&, size_t refs = 0);

        protected:
            ~time_get_byname();
        };
}

```

30.4.6.4 Class template `time_put`[`locale.time.put`]

## 30.4.6.4.1 General

[`locale.time.put.general`]

```

namespace std {
    template<class charT, class OutputIterator = ostreambuf_iterator<charT>>
        class time_put : public locale::facet {
        public:
            using char_type = charT;
            using iter_type = OutputIterator;

            explicit time_put(size_t refs = 0);

            // the following is implemented in terms of other member functions.
            iter_type put(iter_type s, ios_base& f, char_type fill, const tm* tmb,
                const charT* pattern, const charT* pat_end) const;
            iter_type put(iter_type s, ios_base& f, char_type fill,
                const tm* tmb, char format, char modifier = 0) const;

            static locale::id id;

        protected:
            ~time_put();
            virtual iter_type do_put(iter_type s, ios_base&, char_type, const tm* t,
                char format, char modifier) const;
        };
}

```

## 30.4.6.4.2 Members

[`locale.time.put.members`]

```

iter_type put(iter_type s, ios_base& str, char_type fill, const tm* t,
    const charT* pattern, const charT* pat_end) const;
iter_type put(iter_type s, ios_base& str, char_type fill, const tm* t,
    char format, char modifier = 0) const;

```

*Effects:* The first form steps through the sequence from `pattern` to `pat_end`, identifying characters that are part of a format sequence. Each character that is not part of a format sequence is written to `s` immediately, and each format sequence, as it is identified, results in a call to `do_put`; thus, format elements and other characters are interleaved in the output in the order in which they appear in the pattern. Format sequences are identified by converting each character `c` to a `char` value as if by `ct.narrow(c, 0)`, where `ct` is a reference to `ctype<charT>` obtained from `str.getloc()`. The first character of each sequence is equal to `'%'`, followed by an optional modifier character `mod`<sup>256</sup> and a format specifier character `spec` as defined for the function `strftime`. If no modifier character is present, `mod` is zero. For each valid format sequence identified, calls `do_put(s, str, fill, t, spec, mod)`.

The second form calls `do_put(s, str, fill, t, format, modifier)`.

NOTE The `fill` argument can be used in the implementation-defined formats or by derivations. A space character is a reasonable default for this argument.

256) Although the C programming language defines no modifiers, most vendors do.

*Returns:* An iterator pointing immediately after the last character produced.

#### 30.4.6.4.3 Virtual functions

[`locale.time.put.virtuals`]

```
iter_type do_put(iter_type s, ios_base&, char_type fill, const tm* t,
                char format, char modifier) const;
```

*Effects:* Formats the contents of the parameter `t` into characters placed on the output sequence `s`. Formatting is controlled by the parameters `format` and `modifier`, interpreted identically as the format specifiers in the string argument to the standard library function `strftime()`, except that the sequence of characters produced for those specifiers that are described as depending on the C locale are instead implementation-defined.

NOTE 1 Interpretation of the `modifier` argument is implementation-defined.

*Returns:* An iterator pointing immediately after the last character produced.

NOTE 2 The `fill` argument can be used in the implementation-defined formats or by derivations. A space character is a reasonable default for this argument.

Recommended practice: Interpretation of the `modifier` should follow the conventions of ISO/IEC/IEEE 9945:2009. Implementations should refer to other standards such as ISO/IEC/IEEE 9945:2009 for a specification of the character sequences produced for those specifiers described as depending on the C locale.

#### 30.4.6.5 Class template `time_put_byname`

[`locale.time.put.byname`]

```
namespace std {
    template<class charT, class OutputIterator = ostreambuf_iterator<charT>>
        class time_put_byname : public time_put<charT, OutputIterator> {
        public:
            using char_type = charT;
            using iter_type = OutputIterator;

            explicit time_put_byname(const char*, size_t refs = 0);
            explicit time_put_byname(const string&, size_t refs = 0);

        protected:
            ~time_put_byname();
        };
}
```

### 30.4.7 The monetary category

[`category.monetary`]

#### 30.4.7.1 General

[`category.monetary.general`]

These templates handle monetary formats. A template parameter indicates whether local or international monetary formats are to be used.

All specifications of member functions for `money_put` and `money_get` in the subclauses of 30.4.7 only apply to the specializations required in Tables 104 and 105 (30.3.1.2.1). Their members use their `ios_base&`, `ios_base::iostate&`, and `fill` arguments as described in 30.4, and the `money_punct<>` and `ctype<>` facets, to determine formatting details.

#### 30.4.7.2 Class template `money_get`

[`locale.money.get`]

##### 30.4.7.2.1 General

[`locale.money.get.general`]

```
namespace std {
    template<class charT, class InputIterator = istreambuf_iterator<charT>>
        class money_get : public locale::facet {
        public:
            using char_type = charT;
            using iter_type = InputIterator;
            using string_type = basic_string<charT>;

            explicit money_get(size_t refs = 0);
```

```

    iter_type get(iter_type s, iter_type end, bool intl,
                  ios_base& f, ios_base::iostate& err,
                  long double& units) const;
    iter_type get(iter_type s, iter_type end, bool intl,
                  ios_base& f, ios_base::iostate& err,
                  string_type& digits) const;

    static locale::id id;

protected:
    ~money_get();
    virtual iter_type do_get(iter_type, iter_type, bool, ios_base&,
                             ios_base::iostate& err, long double& units) const;
    virtual iter_type do_get(iter_type, iter_type, bool, ios_base&,
                             ios_base::iostate& err, string_type& digits) const;
};
}

```

#### 30.4.7.2.2 Members

[locale.money.get.members]

```

iter_type get(iter_type s, iter_type end, bool intl, ios_base& f,
              ios_base::iostate& err, long double& quant) const;
iter_type get(iter_type s, iter_type end, bool intl, ios_base& f,
              ios_base::iostate& err, string_type& quant) const;

```

*Returns:* do\_get(s, end, intl, f, err, quant).

#### 30.4.7.2.3 Virtual functions

[locale.money.get.virtuals]

```

iter_type do_get(iter_type s, iter_type end, bool intl, ios_base& str,
                 ios_base::iostate& err, long double& units) const;
iter_type do_get(iter_type s, iter_type end, bool intl, ios_base& str,
                 ios_base::iostate& err, string_type& digits) const;

```

*Effects:* Reads characters from *s* to parse and construct a monetary value according to the format specified by a `money_punct<charT, Intl>` facet reference *mp* and the character mapping specified by a `ctype<charT>` facet reference *ct* obtained from the locale returned by `str.getloc()`, and `str.flags()`. If a valid sequence is recognized, does not change *err*; otherwise, sets *err* to `(err|str.failbit)`, or `(err|str.failbit|str.eofbit)` if no more characters are available, and does not change *units* or *digits*. Uses the pattern returned by `mp.neg_format()` to parse all values. The result is returned as an integral value stored in *units* or as a sequence of digits possibly preceded by a minus sign (as produced by `ct.widen(c)` where *c* is '-' or in the range from '0' through '9' (inclusive)) stored in *digits*.

EXAMPLE 1 The sequence \$1,056.23 in a common United States locale would yield, for *units*, 105623, or, for *digits*, "105623".

If `mp.grouping()` indicates that no thousands separators are permitted, any such characters are not read, and parsing is terminated at the point where they first appear. Otherwise, thousands separators are optional; if present, they are checked for correct placement only after all format components have been read.

Where `money_base::space` or `money_base::none` appears as the last element in the format pattern, no whitespace is consumed. Otherwise, where `money_base::space` appears in any of the initial elements of the format pattern, at least one whitespace character is required. Where `money_base::none` appears in any of the initial elements of the format pattern, whitespace is allowed but not required. If `(str.flags() & str.showbase)` is false, the currency symbol is optional and is consumed only if other characters are needed to complete the format; otherwise, the currency symbol is required.

If the first character (if any) in the string *pos* returned by `mp.positive_sign()` or the string *neg* returned by `mp.negative_sign()` is recognized in the position indicated by *sign* in the format pattern, it is consumed and any remaining characters in the string are required after all the other format components.

EXAMPLE 2 If `showbase` is off, then for a *neg* value of "(" and a currency symbol of "L", in "(100 L)" the "L" is consumed; but if *neg* is "-", the "L" in "-100 L" is not consumed.

If `pos` or `neg` is empty, the sign component is optional, and if no sign is detected, the result is given the sign that corresponds to the source of the empty string. Otherwise, the character in the indicated position shall match the first character of `pos` or `neg`, and the result is given the corresponding sign. If the first character of `pos` is equal to the first character of `neg`, or if both strings are empty, the result is given a positive sign.

Digits in the numeric monetary component are extracted and placed in `digits`, or into a character buffer `buf1` for conversion to produce a value for `units`, in the order in which they appear, preceded by a minus sign if and only if the result is negative. The value `units` is produced as if by<sup>257</sup>

```
for (int i = 0; i < n; ++i)
    buf2[i] = src[find(atoms, atoms+sizeof(src), buf1[i]) - atoms];
buf2[n] = 0;
sscanf(buf2, "%Lf", &units);
```

where `n` is the number of characters placed in `buf1`, `buf2` is a character buffer, and the values `src` and `atoms` are defined as if by

```
static const char src[] = "0123456789-";
charT atoms[sizeof(src)];
ct.widen(src, src + sizeof(src) - 1, atoms);
```

*Returns:* An iterator pointing immediately beyond the last character recognized as part of a valid monetary quantity.

### 30.4.7.3 Class template `money_put`

[`locale.money.put`]

#### 30.4.7.3.1 General

[`locale.money.put.general`]

```
namespace std {
    template<class charT, class OutputIterator = ostreambuf_iterator<charT>>
        class money_put : public locale::facet {
        public:
            using char_type = charT;
            using iter_type = OutputIterator;
            using string_type = basic_string<charT>;

            explicit money_put(size_t refs = 0);

            iter_type put(iter_type s, bool intl, ios_base& f,
                          char_type fill, long double units) const;
            iter_type put(iter_type s, bool intl, ios_base& f,
                          char_type fill, const string_type& digits) const;

            static locale::id id;

        protected:
            ~money_put();
            virtual iter_type do_put(iter_type, bool, ios_base&, char_type fill,
                                     long double units) const;
            virtual iter_type do_put(iter_type, bool, ios_base&, char_type fill,
                                     const string_type& digits) const;
        };
}
```

#### 30.4.7.3.2 Members

[`locale.money.put.members`]

```
iter_type put(iter_type s, bool intl, ios_base& f, char_type fill, long double quant) const;
iter_type put(iter_type s, bool intl, ios_base& f, char_type fill, const string_type& quant) const;
```

*Returns:* `do_put(s, intl, f, loc, quant)`.

#### 30.4.7.3.3 Virtual functions

[`locale.money.put.virtuals`]

```
iter_type do_put(iter_type s, bool intl, ios_base& str,
                  char_type fill, long double units) const;
```

<sup>257</sup>) The semantics here are different from `ct.narrow`.

```
iter_type do_put(iter_type s, bool intl, ios_base& str,
                char_type fill, const string_type& digits) const;
```

*Effects:* Writes characters to `s` according to the format specified by a `moneypunct<charT, Intl>` facet reference `mp` and the character mapping specified by a `ctype<charT>` facet reference `ct` obtained from the locale returned by `str.getloc()`, and `str.flags()`. The argument `units` is transformed into a sequence of wide characters as if by

```
ct.widen(buf1, buf1 + sprintf(buf1, "%.0Lf", units), buf2)
```

for character buffers `buf1` and `buf2`. If the first character in `digits` or `buf2` is equal to `ct.widen('')`, then the pattern used for formatting is the result of `mp.neg_format()`; otherwise the pattern is the result of `mp.pos_format()`. Digit characters are written, interspersed with any thousands separators and decimal point specified by the format, in the order they appear (after the optional leading minus sign) in `digits` or `buf2`. In `digits`, only the optional leading minus sign and the immediately subsequent digit characters (as classified according to `ct`) are used; any trailing characters (including digits appearing after a non-digit character) are ignored. Calls `str.width(0)`.

*Returns:* An iterator pointing immediately after the last character produced.

*Remarks:* The currency symbol is generated if and only if `(str.flags() & str.showbase)` is nonzero. If the number of characters generated for the specified format is less than the value returned by `str.width()` on entry to the function, then copies of `fill` are inserted as necessary to pad to the specified width. For the value `af` equal to `(str.flags() & str.adjustfield)`, if `(af == str.internal)` is true, the fill characters are placed where `none` or `space` appears in the formatting pattern; otherwise if `(af == str.left)` is true, they are placed after the other characters; otherwise, they are placed before the other characters.

NOTE It is possible, with some combinations of format patterns and flag values, to produce output that cannot be parsed using `num_get<>::get`.

#### 30.4.7.4 Class template `moneypunct`

[`locale.moneypunct`]

##### 30.4.7.4.1 General

[`locale.moneypunct.general`]

```
namespace std {
    class money_base {
    public:
        enum part { none, space, symbol, sign, value };
        struct pattern { char field[4]; };
    };

    template<class charT, bool International = false>
    class moneypunct : public locale::facet, public money_base {
    public:
        using char_type = charT;
        using string_type = basic_string<charT>;

        explicit moneypunct(size_t refs = 0);

        charT decimal_point() const;
        charT thousands_sep() const;
        string grouping() const;
        string_type curr_symbol() const;
        string_type positive_sign() const;
        string_type negative_sign() const;
        int frac_digits() const;
        pattern pos_format() const;
        pattern neg_format() const;

        static locale::id id;
        static const bool intl = International;

    protected:
        ~moneypunct();
        virtual charT do_decimal_point() const;
        virtual charT do_thousands_sep() const;
```

```

    virtual string      do_grouping()      const;
    virtual string_type do_curr_symbol()   const;
    virtual string_type do_positive_sign() const;
    virtual string_type do_negative_sign() const;
    virtual int         do_frac_digits()   const;
    virtual pattern     do_pos_format()    const;
    virtual pattern     do_neg_format()    const;
};
}

```

The `money_punct<>` facet defines monetary formatting parameters used by `money_get<>` and `money_put<>`. A monetary format is a sequence of four components, specified by a `pattern` value `p`, such that the `part` value `static_cast<part>(p.field[i])` determines the  $i^{\text{th}}$  component of the format<sup>258</sup>. In the `field` member of a `pattern` object, each value `symbol`, `sign`, `value`, and either `space` or `none` appears exactly once. The value `none`, if present, is not first; the value `space`, if present, is neither first nor last.

Where `none` or `space` appears, whitespace is permitted in the format, except where `none` appears at the end, in which case no whitespace is permitted. The value `space` indicates that at least one space is required at that position. Where `symbol` appears, the sequence of characters returned by `curr_symbol()` is permitted, and can be required. Where `sign` appears, the first (if any) of the sequence of characters returned by `positive_sign()` or `negative_sign()` (respectively as the monetary value is non-negative or negative) is required. Any remaining characters of the sign sequence are required after all other format components. Where `value` appears, the absolute numeric monetary value is required.

The format of the numeric monetary value is a decimal number:

```

value:
    units fractionalopt
    decimal-point digits

fractional:
    decimal-point digitsopt

```

if `frac_digits()` returns a positive value, or

```

value:
    units

```

otherwise. The symbol `decimal-point` indicates the character returned by `decimal_point()`. The other symbols are defined as follows:

```

units:
    digits
    digits thousands-sep units

digits:
    adigit digitsopt

```

In the syntax specification, the symbol `adigit` is any of the values `ct.widen(c)` for `c` in the range '0' through '9' (inclusive) and `ct` is a reference of type `const ctype<charT>&` obtained as described in the definitions of `money_get<>` and `money_put<>`. The symbol `thousands-sep` is the character returned by `thousands_sep()`. The space character used is the value `ct.widen(' ')`. Whitespace characters are those characters `c` for which `ci.is(space, c)` returns `true`. The number of digits required after the decimal point (if any) is exactly the value returned by `frac_digits()`.

The placement of thousands-separator characters (if any) is determined by the value returned by `grouping()`, defined identically as the member `num_punct<>::do_grouping()`.

#### 30.4.7.4.2 Members

[`locale.money_punct.members`]

```

charT      decimal_point() const;
charT      thousands_sep() const;
string     grouping()      const;
string_type curr_symbol()   const;
string_type positive_sign() const;
string_type negative_sign() const;
int        frac_digits()   const;
pattern    pos_format()    const;

```

<sup>258</sup>) An array of `char`, rather than an array of `part`, is specified for `pattern::field` purely for efficiency.

```
pattern      neg_format()    const;
```

Each of these functions *F* returns the result of calling the corresponding virtual member function `do_F()`.

#### 30.4.7.4.3 Virtual functions

[`locale.money_punct.virtuals`]

```
charT do_decimal_point() const;
```

*Returns:* The radix separator to use in case `do_frac_digits()` is greater than zero.<sup>259</sup>

```
charT do_thousands_sep() const;
```

*Returns:* The digit group separator to use in case `do_grouping()` specifies a digit grouping pattern.<sup>260</sup>

```
string do_grouping() const;
```

*Returns:* A pattern defined identically as, but not necessarily equal to, the result of `num_punct<charT>::do_grouping()`.<sup>261</sup>

```
string_type do_curr_symbol() const;
```

*Returns:* A string to use as the currency identifier symbol.

NOTE For specializations where the second template parameter is `true`, this is typically four characters long: a three-letter code as specified by ISO 4217<sup>[1]</sup> followed by a space.

```
string_type do_positive_sign() const;
```

```
string_type do_negative_sign() const;
```

*Returns:* `do_positive_sign()` returns the string to use to indicate a positive monetary value;<sup>262</sup> `do_negative_sign()` returns the string to use to indicate a negative value.

```
int do_frac_digits() const;
```

*Returns:* The number of digits after the decimal radix separator, if any.<sup>263</sup>

```
pattern do_pos_format() const;
```

```
pattern do_neg_format() const;
```

*Returns:* The specializations required in Table 105 (30.3.1.2.1), namely

- `money_punct<char>`,
- `money_punct<wchar_t>`,
- `money_punct<char, true>`, and
- `money_punct<wchar_t, true>`,

return an object of type `pattern` initialized to { `symbol`, `sign`, `none`, `value` }.<sup>264</sup>

#### 30.4.7.5 Class template `money_punct_byname`

[`locale.money_punct.byname`]

```
namespace std {
    template<class charT, bool Intl = false>
    class money_punct_byname : public money_punct<charT, Intl> {
    public:
        using pattern      = money_base::pattern;
        using string_type = basic_string<charT>;

        explicit money_punct_byname(const char*, size_t refs = 0);
        explicit money_punct_byname(const string&, size_t refs = 0);

    protected:
        ~money_punct_byname();
    };
}
```

259) In common U.S. locales this is `'.'`.

260) In common U.S. locales this is `','`.

261) To specify grouping by 3s, the value is `"\003"` not `"3"`.

262) This is usually the empty string.

263) In common U.S. locales, this is 2.

264) Note that the international symbol returned by `do_curr_symbol()` usually contains a space, itself; for example, `"USD "`.

**30.4.8 The message retrieval category**

[category.messages]

**30.4.8.1 General**

[category.messages.general]

Class `messages<charT>` implements retrieval of strings from message catalogs.

**30.4.8.2 Class template messages**

[locale.messages]

**30.4.8.2.1 General**

[locale.messages.general]

```
namespace std {
    class messages_base {
    public:
        using catalog = unspecified signed integer type;
    };

    template<class charT>
    class messages : public locale::facet, public messages_base {
    public:
        using char_type = charT;
        using string_type = basic_string<charT>;

        explicit messages(size_t refs = 0);

        catalog open(const string& fn, const locale&) const;
        string_type get(catalog c, int set, int msgid,
                       const string_type& dfault) const;
        void close(catalog c) const;

        static locale::id id;

    protected:
        ~messages();
        virtual catalog do_open(const string&, const locale&) const;
        virtual string_type do_get(catalog, int set, int msgid,
                                   const string_type& dfault) const;
        virtual void do_close(catalog) const;
    };
}
```

Values of type `messages_base::catalog` usable as arguments to members `get` and `close` can be obtained only by calling member `open`.

**30.4.8.2.2 Members**

[locale.messages.members]

```
catalog open(const string& name, const locale& loc) const;
```

*Returns:* `do_open(name, loc)`.

```
string_type get(catalog cat, int set, int msgid, const string_type& dfault) const;
```

*Returns:* `do_get(cat, set, msgid, dfault)`.

```
void close(catalog cat) const;
```

*Effects:* Calls `do_close(cat)`.

**30.4.8.2.3 Virtual functions**

[locale.messages.virtuals]

```
catalog do_open(const string& name, const locale& loc) const;
```

*Returns:* A value that may be passed to `get()` to retrieve a message from the message catalog identified by the string `name` according to an implementation-defined mapping. The result can be used until it is passed to `close()`.

Returns a value less than 0 if no such catalog can be opened.

*Remarks:* The locale argument `loc` is used for character set code conversion when retrieving messages, if needed.

```
string_type do_get(catalog cat, int set, int msgid, const string_type& default) const;
```

*Preconditions:* `cat` is a catalog obtained from `open()` and not yet closed.

*Returns:* A message identified by arguments `set`, `msgid`, and `default`, according to an implementation-defined mapping. If no such message can be found, returns `default`.

```
void do_close(catalog cat) const;
```

*Preconditions:* `cat` is a catalog obtained from `open()` and not yet closed.

*Effects:* Releases unspecified resources associated with `cat`.

*Remarks:* The limit on such resources, if any, is implementation-defined.

### 30.4.8.3 Class template `messages_byname`

[`locale.messages.byname`]

```
namespace std {
    template<class charT>
    class messages_byname : public messages<charT> {
    public:
        using catalog      = messages_base::catalog;
        using string_type = basic_string<charT>;

        explicit messages_byname(const char*, size_t refs = 0);
        explicit messages_byname(const string&, size_t refs = 0);

    protected:
        ~messages_byname();
    };
}
```

## 30.5 C library locales

[`c.locales`]

### 30.5.1 Header `<locale>` synopsis

[`clocale.syn`]

```
namespace std {
    struct lconv;

    char* setlocale(int category, const char* locale);
    lconv* localeconv();
}

#define NULL see 17.2.3
#define LC_ALL see below
#define LC_COLLATE see below
#define LC_CTYPE see below
#define LC_MONETARY see below
#define LC_NUMERIC see below
#define LC_TIME see below
```

The contents and meaning of the header `<clocale>` are the same as the C standard library header `<locale.h>`.

### 30.5.2 Data races

[`clocale.data.races`]

Calls to the function `setlocale` may introduce a data race (16.4.6.10) with other calls to `setlocale` or with calls to the functions listed in Table 116.

See also ISO/IEC 9899:2018, 7.11.

Table 116 — Potential `setlocale` data races [tab:setlocale.data.races]

|                      |                       |                        |                         |                      |

# 31 Input/output library [input.output]

## 31.1 General [input.output.general]

This Clause describes components that C++ programs may use to perform input/output operations.

The following subclauses describe requirements for stream parameters, and components for forward declarations of iostreams, predefined iostreams objects, base iostreams classes, stream buffering, stream formatting and manipulators, string streams, and file streams, as summarized in [Table 117](#).

**Table 117 — Input/output library summary** [tab:iostreams.summary]

| Subclause                                         | Header                                                                                                                  |
|---------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| <a href="#">31.2</a> Requirements                 |                                                                                                                         |
| <a href="#">31.3</a> Forward declarations         | <code>&lt;iosfwd&gt;</code>                                                                                             |
| <a href="#">31.4</a> Standard iostream objects    | <code>&lt;iostream&gt;</code>                                                                                           |
| <a href="#">31.5</a> Iostreams base classes       | <code>&lt;ios&gt;</code>                                                                                                |
| <a href="#">31.6</a> Stream buffers               | <code>&lt;streambuf&gt;</code>                                                                                          |
| <a href="#">31.7</a> Formatting and manipulators  | <code>&lt;istream&gt;</code> , <code>&lt;ostream&gt;</code> , <code>&lt;iomanip&gt;</code> , <code>&lt;print&gt;</code> |

| <a href="#">31.9</a> Span-based streams           | <code>&lt;spanstream&gt;</code>                                                                                         |
| <a href="#">31.10</a> File streams                | <code>&lt;fstream&gt;</code>                                                                                            |
| <a href="#">31.11</a> Synchronized output streams | <code>&lt;syncstream&gt;</code>                                                                                         |
| <a href="#">31.12</a> File systems                | <code>&lt;filesystem&gt;</code>                                                                                         |
| <a href="#">31.13</a> C library files             | <code>&lt;stdio&gt;</code> , <code>&lt;cinttypes&gt;</code>                                                             |

## 31.2 Iostreams requirements [iostreams.requirements]

### 31.2.1 Imbue limitations [iostream.limits.imbue]

No function described in [Clause 31](#) except for `ios_base::imbue` and `basic_filebuf::pubimbue` causes any instance of `basic_ios::imbue` or `basic_streambuf::imbue` to be called. If any user function called from a function declared in [Clause 31](#) or as an overriding virtual function of any class declared in [Clause 31](#) calls `imbue`, the behavior is undefined.

### 31.2.2 Types [stream.types]

```
using streamoff = implementation-defined;
```

The type `streamoff` is a synonym for one of the signed basic integral types of sufficient size to represent the maximum possible file size for the operating system.<sup>265</sup>

```
using streamsize = implementation-defined;
```

The type `streamsize` is a synonym for one of the signed basic integral types. It is used to represent the number of characters transferred in an I/O operation, or the size of I/O buffers.<sup>266</sup>

### 31.2.3 Positioning type limitations [iostreams.limits.pos]

The classes of [Clause 31](#) with template arguments `charT` and `traits` behave as described if `traits::pos_type` and `traits::off_type` are `streampos` and `streamoff` respectively. Except as noted explicitly below, their behavior when `traits::pos_type` and `traits::off_type` are other types is implementation-defined.

NOTE For each of the specializations of `char_traits` defined in [23.2.4](#), `state_type` denotes `mbstate_t`, `pos_type` denotes `fpos<mbstate_t>`, and `off_type` denotes `streamoff`.

In the classes of [Clause 31](#), a template parameter with name `charT` represents a member of the set of types containing `char`, `wchar_t`, and any other implementation-defined character types that meet the requirements for a character on which any of the iostream components can be instantiated.

<sup>265</sup>) Typically `long long`.

<sup>266</sup>) Most places where `streamsize` is used would use `size_t` in C, or `ssize_t` in ISO/IEC/IEEE 9945.

### 31.2.4 Thread safety

[iostreams.threadsafety]

Concurrent access to a stream object (31.8, 31.10), stream buffer object (31.6), or C Library stream (31.13) by multiple threads may result in a data race (6.9.2) unless otherwise specified (31.4).

NOTE Data races result in undefined behavior (6.9.2).

If one thread makes a library call *a* that writes a value to a stream and, as a result, another thread reads this value from the stream through a library call *b* such that this does not result in a data race, then *a*'s write synchronizes with *b*'s read.

### 31.3 Forward declarations

[iostream.forward]

#### 31.3.1 Header <iosfwd> synopsis

[iosfwd.syn]

```
namespace std {
    template<class charT> struct char_traits;
    template<> struct char_traits<char>;
    template<> struct char_traits<char8_t>;
    template<> struct char_traits<char16_t>;
    template<> struct char_traits<char32_t>;
    template<> struct char_traits<wchar_t>;

    template<class T> class allocator;

    template<class charT, class traits = char_traits<charT>>
        class basic_ios;
    template<class charT, class traits = char_traits<charT>>
        class basic_streambuf;
    template<class charT, class traits = char_traits<charT>>
        class basic_istream;
    template<class charT, class traits = char_traits<charT>>
        class basic_ostream;
    template<class charT, class traits = char_traits<charT>>
        class basic_iostream;

    template<class charT, class traits = char_traits<charT>,
        class Allocator = allocator<charT>>
        class basic_stringbuf;

using spanstream   = basic_spanstream<char>;

using filebuf      = basic_filebuf<char>;
using ifstream     = basic_ifstream<char>;
using ofstream     = basic_ofstream<char>;
using fstream      = basic_fstream<char>;

using syncbuf      = basic_syncbuf<char>;
using osyncstream  = basic_osyncstream<char>;

using wstreambuf   = basic_streambuf<wchar_t>;
using wistream     = basic_istream<wchar_t>;
using wostream     = basic_ostream<wchar_t>;
using wiostream    = basic_iostream<wchar_t>;

using wstringbuf   = basic_stringbuf<wchar_t>;
using wistringstream = basic_istream<wchar_t>;
using wostringstream = basic_ostream<wchar_t>;
using wstringstream = basic_stringstream<wchar_t>;

using wspanbuf     = basic_spanbuf<wchar_t>;
using wispanstream = basic_ispanstream<wchar_t>;
using wospanstream = basic_ostream<wchar_t>;
using wspanstream  = basic_spanstream<wchar_t>;

using wfilebuf     = basic_filebuf<wchar_t>;
using wifstream    = basic_ifstream<wchar_t>;
using wofstream    = basic_ofstream<wchar_t>;
using wfstream     = basic_fstream<wchar_t>;

using wsyncbuf     = basic_syncbuf<wchar_t>;
using wosyncstream = basic_osyncstream<wchar_t>;

template<class state> class fpos;
using streampos    = fpos<char_traits<char>::state_type>;
using wstreampos   = fpos<char_traits<wchar_t>::state_type>;

```

```

using u8streampos = fpos<char_traits<char8_t>::state_type>;
using u16streampos = fpos<char_traits<char16_t>::state_type>;
using u32streampos = fpos<char_traits<char32_t>::state_type>;
}

```

Default template arguments are described as appearing both in `<iosfwd>` and in the synopsis of other headers but it is well-formed to include both `<iosfwd>` and one or more of the other headers.<sup>267</sup>

### 31.3.2 Overview

[[iostream.forward.overview](#)]

The class template specialization `basic_ios<charT, traits>` serves as a virtual base class for the class templates `basic_istream`, `basic_ostream`, and class templates derived from them. `basic_iostream` is a class template derived from both `basic_istream<charT, traits>` and `basic_ostream<charT, traits>`.

The class template specialization `basic_streambuf<charT, traits>` serves as a base class for class templates `basic_stringbuf`, `basic_filebuf`, and `basic_syncbuf`.

The class template specialization `basic_istream<charT, traits>` serves as a base class for class templates `basic_istreamstream` and `basic_ifstream`.

The class template specialization `basic_ostream<charT, traits>` serves as a base class for class templates `basic_ostreamstream`, `basic_ofstream`, and `basic_osyncstream`.

The class template specialization `basic_iostream<charT, traits>` serves as a base class for class templates `basic_stringstream` and `basic_fstream`.

NOTE 1 For each of the class templates above, the program is ill-formed if `traits::char_type` is not the same type as `charT` (23.2).

Other *typedef-names* define instances of class templates specialized for `char` or `wchar_t` types.

Specializations of the class template `fpos` are used for specifying file position information.

EXAMPLE The types `streampos` and `wstreampos` are used for positioning streams specialized on `char` and `wchar_t` respectively.

NOTE 2 This synopsis suggests a circularity between `streampos` and `char_traits<char>`. An implementation can avoid this circularity by substituting equivalent types.

## 31.4 Standard iostream objects

[[iostream.objects](#)]

### 31.4.1 Header `<iostream>` synopsis

[[iostream.syn](#)]

```

#include <ios>           // see 31.5.1
#include <streambuf>      // see 31.6.1
#include <istream>        // see 31.7.1
#include <ostream>        // see 31.7.2

namespace std {
    extern istream cin;
    extern ostream cout;
    extern ostream cerr;
    extern ostream clog;

    extern wistream wcin;
    extern wostream wcout;
    extern wostream wcerr;
    extern wostream wclog;
}

```

### 31.4.2 Overview

[[iostream.objects.overview](#)]

In this Clause, the type name `FILE` refers to the type `FILE` declared in `<cstdio>` (31.13.1).

The header `<iostream>` declares objects that associate objects with the standard C streams provided for by the functions declared in `<cstdio>`, and includes all the headers necessary to use these objects.

<sup>267</sup>) It is the implementation's responsibility to implement headers so that including `<iosfwd>` and other headers does not violate the rules about multiple occurrences of default arguments.

The objects are constructed and the associations are established at some time prior to or during the first time an object of class `ios_base::Init` is constructed, and in any case before the body of `main` (6.9.3.1) begins execution. The objects are not destroyed during program execution.<sup>268</sup>

Recommended practice: If it is possible for them to do so, implementations should initialize the objects earlier than required.

The results of including `<iostream>` in a translation unit shall be as if `<iostream>` defined an instance of `ios_base::Init` with static storage duration. Each C++ library module (16.4.2.4) in a hosted implementation shall behave as if it contains an interface unit that defines an unexported `ios_base::Init` variable with ordered initialization (6.9.3.3).

NOTE 1 As a result, the definition of that variable is appearance-ordered before any declaration following the point of importation of a C++ library module. Whether such a definition exists is unobservable by a program that does not reference any of the standard iostream objects.

Mixing operations on corresponding wide- and narrow-character streams follows the same semantics as mixing such operations on `FILES`, as specified in the C standard library.

Concurrent access to a synchronized (31.5.2.5) standard iostream object's formatted and unformatted input (31.7.5.2) and output (31.7.6.2) functions or a standard C stream by multiple threads does not result in a data race (6.9.2).

NOTE 2 Unsynchronized concurrent use of these objects and streams by multiple threads can result in interleaved characters.

See also ISO/IEC 9899:2018, 7.21.2.

### 31.4.3 Narrow stream objects

[`narrow.stream.objects`]

`istream cin;`

The object `cin` controls input from a stream buffer associated with the object `stdin`, declared in `<cstdio>` (31.13.1).

After the object `cin` is initialized, `cin.tie()` returns `&cout`. Its state is otherwise the same as required for `basic_ios<char>::init` (31.5.4.2).

`ostream cout;`

The object `cout` controls output to a stream buffer associated with the object `stdout`, declared in `<cstdio>` (31.13.1).

`ostream cerr;`

The object `cerr` controls output to a stream buffer associated with the object `stderr`, declared in `<cstdio>` (31.13.1).

After the object `cerr` is initialized, `cerr.flags() & unitbuf` is nonzero and `cerr.tie()` returns `&cout`. Its state is otherwise the same as required for `basic_ios<char>::init` (31.5.4.2).

`ostream clog;`

The object `clog` controls output to a stream buffer associated with the object `stderr`, declared in `<cstdio>` (31.13.1).

### 31.4.4 Wide stream objects

[`wide.stream.objects`]

`wistream wcin;`

The object `wcin` controls input from a stream buffer associated with the object `stdin`, declared in `<cstdio>` (31.13.1).

After the object `wcin` is initialized, `wcin.tie()` returns `&wcout`. Its state is otherwise the same as required for `basic_ios<wchar_t>::init` (31.5.4.2).

`wostream wcout;`

The object `wcout` controls output to a stream buffer associated with the object `stdout`, declared in `<cstdio>` (31.13.1).

<sup>268</sup>) Constructors and destructors for objects with static storage duration can access these objects to read input from `stdin` or write output to `stdout` or `stderr`.

wostream wcerr;

The object `wcerr` controls output to a stream buffer associated with the object `stderr`, declared in `<cstdio>` (31.13.1).

After the object `wcerr` is initialized, `wcerr.flags()` & `unitbuf` is nonzero and `wcerr.tie()` returns `&wcout`. Its state is otherwise the same as required for `basic_ios<wchar_t>::init` (31.5.4.2).

wostream wlog;

The object `wlog` controls output to a stream buffer associated with the object `stderr`, declared in `<cstdio>` (31.13.1).

## 31.5 Iostreams base classes

[iostreams.base]

### 31.5.1 Header `<ios>` synopsis

[ios.syn]

```
#include <iosfwd>    // see 31.3.1
```

```
namespace std {
    using streamoff = implementation-defined;
    using streamsize = implementation-defined;
    template<class stateT> class fpos;

    class ios_base;
    template<class charT, class traits = char_traits<charT>>
        class basic_ios;

    // 31.5.5, manipulators
    ios_base& boolalpha (ios_base& str);
    ios_base& noboolalpha (ios_base& str);

    ios_base& showbase (ios_base& str);
    ios_base& noshowbase (ios_base& str);

    ios_base& showpoint (ios_base& str);
    ios_base& noshowpoint (ios_base& str);

    ios_base& showpos (ios_base& str);
    ios_base& noshowpos (ios_base& str);

    ios_base& skipws (ios_base& str);
    ios_base& noskipws (ios_base& str);

    ios_base& uppercase (ios_base& str);
    ios_base& nouppercase (ios_base& str);

    ios_base& unitbuf (ios_base& str);
    ios_base& nouitbuf (ios_base& str);

    // 31.5.5.2, adjustfield
    ios_base& internal (ios_base& str);
    ios_base& left (ios_base& str);
    ios_base& right (ios_base& str);

    // 31.5.5.3, basefield
    ios_base& dec (ios_base& str);
    ios_base& hex (ios_base& str);
    ios_base& oct (ios_base& str);

    // 31.5.5.4, floatfield
    ios_base& fixed (ios_base& str);
    ios_base& scientific (ios_base& str);
    ios_base& hexfloat (ios_base& str);
    ios_base& defaultfloat (ios_base& str);
}
```

```

// 31.5.6, error reporting
enum class io_errc {
    stream = 1
};

template<> struct is_error_code_enum<io_errc> : public true_type { };
error_code make_error_code(io_errc e) noexcept;
error_condition make_error_condition(io_errc e) noexcept;
const error_category& iostream_category() noexcept;
}

```

## 31.5.2 Class ios\_base

[ios.base]

### 31.5.2.1 General

[ios.base.general]

```

namespace std {
    class ios_base {
    public:
        class failure;                // see below

        // 31.5.2.2.2, fmtflags
        using fmtflags = T1;
        static constexpr fmtflags boolalpha = unspecified;
        static constexpr fmtflags dec = unspecified;
        static constexpr fmtflags fixed = unspecified;
        static constexpr fmtflags hex = unspecified;
        static constexpr fmtflags internal = unspecified;
        static constexpr fmtflags left = unspecified;
        static constexpr fmtflags oct = unspecified;
        static constexpr fmtflags right = unspecified;
        static constexpr fmtflags scientific = unspecified;
        static constexpr fmtflags showbase = unspecified;
        static constexpr fmtflags showpoint = unspecified;
        static constexpr fmtflags showpos = unspecified;
        static constexpr fmtflags skipws = unspecified;
        static constexpr fmtflags unitbuf = unspecified;
        static constexpr fmtflags uppercase = unspecified;
        static constexpr fmtflags adjustfield = see below;
        static constexpr fmtflags basefield = see below;
        static constexpr fmtflags floatfield = see below;

        // 31.5.2.2.3, iostate
        using iostate = T2;
        static constexpr iostate badbit = unspecified;
        static constexpr iostate eofbit = unspecified;
        static constexpr iostate failbit = unspecified;
        static constexpr iostate goodbit = see below;

        // 31.5.2.2.4, openmode
        using openmode = T3;
        static constexpr openmode app = unspecified;
        static constexpr openmode ate = unspecified;
        static constexpr openmode binary = unspecified;
        static constexpr openmode in = unspecified;
        static constexpr openmode noreplace = unspecified;
        static constexpr openmode out = unspecified;
        static constexpr openmode trunc = unspecified;

        // 31.5.2.2.5, seekdir
        using seekdir = T4;
        static constexpr seekdir beg = unspecified;
        static constexpr seekdir cur = unspecified;
        static constexpr seekdir end = unspecified;

        class Init;
    };
}

```

```

// 31.5.2.3, fmtflags state
fmtflags flags() const;
fmtflags flags(fmtflags fmtfl);
fmtflags setf(fmtflags fmtfl);
fmtflags setf(fmtflags fmtfl, fmtflags mask);
void unsetf(fmtflags mask);

streamsize precision() const;
streamsize precision(streamsize prec);
streamsize width() const;
streamsize width(streamsize wide);

// 31.5.2.4, locales
locale imbue(const locale& loc);
locale getloc() const;

// 31.5.2.6, storage
static int xalloc();
long& iword(int idx);
void*& pword(int idx);

// destructor
virtual ~ios_base();

// 31.5.2.7, callbacks
enum event { erase_event, imbue_event, copyfmt_event };
using event_callback = void (*)(event, ios_base&, int idx);
void register_callback(event_callback fn, int idx);

ios_base(const ios_base&) = delete;
ios_base& operator=(const ios_base&) = delete;

static bool sync_with_stdio(bool sync = true);

protected:
    ios_base();

private:
    static int index; // exposition only
    long* iarray; // exposition only
    void** parray; // exposition only
};
}

```

`ios_base` defines several member types:

- a type `failure`, defined as either a class derived from `system_error` or a synonym for a class derived from `system_error`;
- a class `Init`;
- three bitmask types, `fmtflags`, `iostate`, and `openmode`;
- an enumerated type, `seekdir`.

It maintains several kinds of data:

- state information that reflects the integrity of the stream buffer;
- control information that influences how to interpret (format) input sequences and how to generate (format) output sequences;
- additional information that is stored by the program for its private use.

NOTE For the sake of exposition, the maintained data is presented here as:

- `static int index`, specifies the next available unique index for the integer or pointer arrays maintained for the private use of the program, initialized to an unspecified value;

- `long* iarray`, points to the first element of an arbitrary-length `long` array maintained for the private use of the program;
- `void** parray`, points to the first element of an arbitrary-length pointer array maintained for the private use of the program.

### 31.5.2.2 Types

[ios.types]

#### 31.5.2.2.1 Class `ios_base::failure`

[ios.failure]

```
namespace std {
    class ios_base::failure : public system_error {
    public:
        explicit failure(const string& msg, const error_code& ec = io_errc::stream);
        explicit failure(const char* msg, const error_code& ec = io_errc::stream);
    };
}
```

An implementation is permitted to define `ios_base::failure` as a synonym for a class with equivalent functionality to class `ios_base::failure` shown in this subclause.

NOTE 1 When `ios_base::failure` is a synonym for another type, that type needs to provide a nested type `failure` to emulate the injected-class-name.

The class `failure` defines the base class for the types of all objects thrown as exceptions, by functions in the `iostreams` library, to report errors detected during stream buffer operations.

When throwing `ios_base::failure` exceptions, implementations should provide values of `ec` that identify the specific reason for the failure.

NOTE 2 Errors arising from the operating system would typically be reported as `system_category()` errors with an error value of the error number reported by the operating system. Errors arising from within the stream library would typically be reported as `error_code(io_errc::stream, iostream_category())`.

```
explicit failure(const string& msg, const error_code& ec = io_errc::stream);
```

*Effects:* Constructs the base class with `msg` and `ec`.

```
explicit failure(const char* msg, const error_code& ec = io_errc::stream);
```

*Effects:* Constructs the base class with `msg` and `ec`.

#### 31.5.2.2.2 Type `ios_base::fmtflags`

[ios.fmtflags]

```
using fmtflags = T1;
```

The type `fmtflags` is a bitmask type (16.3.3.3.3). Setting its elements has the effects indicated in Table 118.

Type `fmtflags` also defines the constants indicated in Table 119.

#### 31.5.2.2.3 Type `ios_base::iostate`

[ios.iostate]

```
using iostate = T2;
```

The type `iostate` is a bitmask type (16.3.3.3.3) that contains the elements indicated in Table 120.

Type `iostate` also defines the constant:

- `goodbit`, the value zero.

#### 31.5.2.2.4 Type `ios_base::openmode`

[ios.openmode]

```
using openmode = T3;
```

The type `openmode` is a bitmask type (16.3.3.3.3). It contains the elements indicated in Table 121.

#### 31.5.2.2.5 Type `ios_base::seekdir`

[ios.seekdir]

```
using seekdir = T4;
```

The type `seekdir` is an enumerated type (16.3.3.3.2) that contains the elements indicated in Table 122.

Table 118 — `fmtflags` effects [tab:ios.fmtflags]

| Element                 | Effect(s) if set                                                                                                                                   |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>boolalpha</code>  | insert and extract <code>bool</code> type in alphabetic format                                                                                     |
| <code>dec</code>        | converts integer input or generates integer output in decimal base                                                                                 |
| <code>fixed</code>      | generate floating-point output in fixed-point notation                                                                                             |
| <code>hex</code>        | converts integer input or generates integer output in hexadecimal base                                                                             |
| <code>internal</code>   | adds fill characters at a designated internal point in certain generated output, or identical to <code>right</code> if no such point is designated |
| <code>left</code>       | adds fill characters on the right (final positions) of certain generated output                                                                    |
| <code>oct</code>        | converts integer input or generates integer output in octal base                                                                                   |
| <code>right</code>      | adds fill characters on the left (initial positions) of certain generated output                                                                   |
| <code>scientific</code> | generates floating-point output in scientific notation                                                                                             |
| <code>showbase</code>   | generates a prefix indicating the numeric base of generated integer output                                                                         |
| <code>showpoint</code>  | generates a decimal-point character unconditionally in generated floating-point output                                                             |
| <code>showpos</code>    | generates a <code>+</code> sign in non-negative generated numeric output                                                                           |
| <code>skipws</code>     | skips leading whitespace before certain input operations                                                                                           |
| <code>unitbuf</code>    | flushes output after each output operation                                                                                                         |
| <code>uppercase</code>  | replaces certain lowercase letters with their uppercase equivalents in generated output                                                            |

Table 119 — `fmtflags` constants [tab:ios.fmtflags.const]

| Constant                 | Allowable values                                               |
|--------------------------|----------------------------------------------------------------|
| <code>adjustfield</code> | <code>left</code>   <code>right</code>   <code>internal</code> |
| <code>basefield</code>   | <code>dec</code>   <code>oct</code>   <code>hex</code>         |
| <code>floatfield</code>  | <code>scientific</code>   <code>fixed</code>                   |

Table 120 — `iostate` effects [tab:ios.iostate]

| Element              | Effect(s) if set                                                                                                                                 |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>badbit</code>  | indicates a loss of integrity in an input or output sequence (such as an irrecoverable read error from a file);                                  |
| <code>eofbit</code>  | indicates that an input operation reached the end of an input sequence;                                                                          |
| <code>failbit</code> | indicates that an input operation failed to read the expected characters, or that an output operation failed to generate the desired characters. |

31.5.2.2.6 Class `ios_base::Init`

[ios.init]

```

namespace std {
    class ios_base::Init {
    public:
        Init();
        Init(const Init&) = default;
        ~Init();
        Init& operator=(const Init&) = default;

    private:
        static int init_cnt;           // exposition only
    };
}

```

The class `Init` describes an object whose construction ensures the construction of the eight objects declared in `<iostream>` (31.4) that associate file stream buffers with the standard C streams provided for by the functions declared in `<stdio>` (31.13.1).

Table 121 — `openmode` effects [tab:ios.openmode]

| Element                | Effect(s) if set                                                  |
|------------------------|-------------------------------------------------------------------|
| <code>app</code>       | seek to end before each write                                     |
| <code>ate</code>       | open and seek to end immediately after opening                    |
| <code>binary</code>    | perform input and output in binary mode (as opposed to text mode) |
| <code>in</code>        | open for input                                                    |
| <code>noreplace</code> | open in exclusive mode                                            |
| <code>out</code>       | open for output                                                   |
| <code>trunc</code>     | truncate an existing stream when opening                          |

Table 122 — `seekdir` effects [tab:ios.seekdir]

| Element          | Meaning                                                                                 |
|------------------|-----------------------------------------------------------------------------------------|
| <code>beg</code> | request a seek (for subsequent input or output) relative to the beginning of the stream |
| <code>cur</code> | request a seek relative to the current position within the sequence                     |
| <code>end</code> | request a seek relative to the current end of the sequence                              |

For the sake of exposition, the maintained data is presented here as:

- `static int init_cnt`, counts the number of constructor and destructor calls for class `Init`, initialized to zero.

`Init();`

*Effects:* Constructs and initializes the objects `cin`, `cout`, `cerr`, `clog`, `wcin`, `wcout`, `wcerr`, and `wclog` if they have not already been constructed and initialized.

`~Init();`

*Effects:* If there are no other instances of the class still in existence, calls `cout.flush()`, `cerr.flush()`, `clog.flush()`, `wcout.flush()`, `wcerr.flush()`, `wclog.flush()`.

### 31.5.2.3 State functions

[fmtflags.state]

`fmtflags flags() const;`

*Returns:* The format control information for both input and output.

`fmtflags flags(fmtflags fmtfl);`

*Postconditions:* `fmtfl == flags()`.

*Returns:* The previous value of `flags()`.

`fmtflags setf(fmtflags fmtfl);`

*Effects:* Sets `fmtfl` in `flags()`.

*Returns:* The previous value of `flags()`.

`fmtflags setf(fmtflags fmtfl, fmtflags mask);`

*Effects:* Clears `mask` in `flags()`, sets `fmtfl & mask` in `flags()`.

*Returns:* The previous value of `flags()`.

`void unsetf(fmtflags mask);`

*Effects:* Clears `mask` in `flags()`.

`streamsize precision() const;`

*Returns:* The precision to generate on certain output conversions.

```
streamsize precision(streamsize prec);
```

*Postconditions:* `prec == precision()`.

*Returns:* The previous value of `precision()`.

```
streamsize width() const;
```

*Returns:* The minimum field width (number of characters) to generate on certain output conversions.

```
streamsize width(streamsize wide);
```

*Postconditions:* `wide == width()`.

*Returns:* The previous value of `width()`.

#### 31.5.2.4 Functions

[ios.base.locales]

```
locale imbue(const locale& loc);
```

*Effects:* Calls each registered callback pair `(fn, idx)` (31.5.2.7) as `(*fn)(imbue_event, *this, idx)` at such a time that a call to `ios_base::getloc()` from within `fn` returns the new locale value `loc`.

*Postconditions:* `loc == getloc()`.

*Returns:* The previous value of `getloc()`.

```
locale getloc() const;
```

*Returns:* If no locale has been imbued, a copy of the global C++ locale `locale()`, in effect at the time of construction. Otherwise, returns the imbued locale, to be used to perform locale-dependent input and output operations.

#### 31.5.2.5 Static members

[ios.members.static]

```
static bool sync_with_stdio(bool sync = true);
```

*Effects:* If any input or output operation has occurred using the standard streams prior to the call, the effect is implementation-defined. Otherwise, called with a `false` argument, it allows the standard streams to operate independently of the standard C streams.

*Returns:* `true` if the previous state of the standard istream objects (31.4) was synchronized and otherwise returns `false`. The first time it is called, the function returns `true`.

*Remarks:* When a standard istream object `str` is *synchronized* with a standard stdio stream `f`, the effect of inserting a character `c` by

```
fputc(f, c);
```

is the same as the effect of

```
str.rdbuf()->sputc(c);
```

for any sequences of characters; the effect of extracting a character `c` by

```
c = fgetc(f);
```

is the same as the effect of

```
c = str.rdbuf()->sgetc();
```

for any sequences of characters; and the effect of pushing back a character `c` by

```
ungetc(c, f);
```

is the same as the effect of

```
str.rdbuf()->sputbackc(c);
```

for any sequence of characters.<sup>269</sup>

<sup>269</sup>) This implies that operations on a standard istream object can be mixed arbitrarily with operations on the corresponding stdio stream. In practical terms, synchronization usually means that a standard istream object and a standard stdio object share a buffer.

## 31.5.2.6 Storage functions

[ios.base.storage]

```
static int xalloc();
```

*Returns:* index ++.

*Remarks:* Concurrent access to this function by multiple threads does not result in a data race (6.9.2).

```
long& iword(int idx);
```

*Preconditions:* idx is a value obtained by a call to xalloc.

*Effects:* If iarray is a null pointer, allocates an array of long of unspecified size and stores a pointer to its first element in iarray. The function then extends the array pointed at by iarray as necessary to include the element iarray[idx]. Each newly allocated element of the array is initialized to zero. The reference returned is invalid after any other operation on the object.<sup>270</sup> However, the value of the storage referred to is retained, so that until the next call to copyfmt, calling iword with the same index yields another reference to the same value. If the function fails<sup>271</sup> and \*this is a base class subobject of a basic\_ios<> object or subobject, the effect is equivalent to calling basic\_ios<>::setstate(badbit) on the derived object (which may throw failure).

*Returns:* On success iarray[idx]. On failure, a valid long& initialized to 0.

```
void*& pword(int idx);
```

*Preconditions:* idx is a value obtained by a call to xalloc.

*Effects:* If parray is a null pointer, allocates an array of pointers to void of unspecified size and stores a pointer to its first element in parray. The function then extends the array pointed at by parray as necessary to include the element parray[idx]. Each newly allocated element of the array is initialized to a null pointer. The reference returned is invalid after any other operation on the object. However, the value of the storage referred to is retained, so that until the next call to copyfmt, calling pword with the same index yields another reference to the same value. If the function fails<sup>272</sup> and \*this is a base class subobject of a basic\_ios<> object or subobject, the effect is equivalent to calling basic\_ios<>::setstate(badbit) on the derived object (which may throw failure).

*Returns:* On success parray[idx]. On failure a valid void\*& initialized to 0.

*Remarks:* After a subsequent call to pword(int) for the same object, the earlier return value may no longer be valid.

## 31.5.2.7 Callbacks

[ios.base.callback]

```
void register_callback(event_callback fn, int idx);
```

*Preconditions:* The function fn does not throw exceptions.

*Effects:* Registers the pair (fn, idx) such that during calls to imbue() (31.5.2.4), copyfmt(), or ~ios\_base() (31.5.2.8), the function fn is called with argument idx. Functions registered are called when an event occurs, in opposite order of registration. Functions registered while a callback function is active are not called until the next event.

*Remarks:* Identical pairs are not merged. A function registered twice will be called twice.

## 31.5.2.8 Constructors and destructor

[ios.base.cons]

```
ios_base();
```

*Effects:* Each ios\_base member has an indeterminate value after construction. The object's members shall be initialized by calling basic\_ios::init before the object's first use or before it is destroyed, whichever comes first; otherwise the behavior is undefined.

```
~ios_base();
```

*Effects:* Calls each registered callback pair (fn, idx) (31.5.2.7) as (\*fn)(erase\_event, \*this, idx) at such time that any ios\_base member function called from within fn has well-defined results. Then, any memory obtained is deallocated.

<sup>270</sup>) An implementation is free to implement both the integer array pointed at by iarray and the pointer array pointed at by parray as sparse data structures, possibly with a one-element cache for each.

<sup>271</sup>) For example, because it cannot allocate space.

<sup>272</sup>) For example, because it cannot allocate space.

**31.5.3 Class template fpos****[fpos]****31.5.3.1 General****[fpos.general]**

```

namespace std {
    template<class stateT> class fpos {
    public:
        // 31.5.3.2, members
        stateT state() const;
        void state(stateT);

    private:
        stateT st;                // exposition only
    };
}

```

**31.5.3.2 Members****[fpos.members]**

```
void state(stateT s);
```

*Effects:* Assigns *s* to *st*.

```
stateT state() const;
```

*Returns:* Current value of *st*.

**31.5.3.3 Requirements****[fpos.operations]**

An **fpos** type specifies file position information. It holds a state object whose type is equal to the template parameter **stateT**. Type **stateT** shall meet the *Cpp17DefaultConstructible* (Table 30), *Cpp17CopyConstructible* (Table 32), *Cpp17CopyAssignable* (Table 34), and *Cpp17Destructible* (Table 35) requirements. If *is\_trivially\_copy\_constructible\_v<stateT>* is true, then **fpos<stateT>** has a trivial copy constructor. If *is\_trivially\_copy\_assignable\_v<stateT>* is true, then **fpos<stateT>** has a trivial copy assignment operator. If *is\_trivially\_destructible\_v<stateT>* is true, then **fpos<stateT>** has a trivial destructor. All specializations of **fpos** meet the *Cpp17DefaultConstructible*, *Cpp17CopyConstructible*, *Cpp17CopyAssignable*, *Cpp17Destructible*, and *Cpp17EqualityComparable* (Table 28) requirements. In addition, the expressions shown in Table 123 are valid and have the indicated semantics. In that table,

- *P* refers to a specialization of **fpos**,
- *p* and *q* refer to values of type *P* or **const P**,
- *p1* and *q1* refer to modifiable lvalues of type *P*,
- *O* refers to type **streamoff**, and
- *o* and *o2* refer to values of type **streamoff** or **const streamoff**.

**Table 123 — Position type requirements** [tab:fpos.operations]

| Expression                                                        | Return type      | Operational semantics       | Assertion/note pre-/post-condition                                                                                       |

Table 123 — Position type requirements (continued)

| Expression           | Return type                   | Operational semantics  | Assertion/note pre-/post-condition                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------|-------------------------------|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>p == q</code>  | <code>bool</code>             |                        | <i>Remarks:</i> For any two values <code>o</code> and <code>o2</code> , if <code>p</code> is obtained from <code>o</code> converted to <code>P</code> or from a copy of such <code>P</code> value and if <code>q</code> is obtained from <code>o2</code> converted to <code>P</code> or from a copy of such <code>P</code> value, then <code>p == q</code> is true only if <code>o == o2</code> is true. |
| <code>p != q</code>  | <code>bool</code>             | <code>!(p == q)</code> |                                                                                                                                                                                                                                                                                                                                                                                                          |
| <code>p + o</code>   | <code>P</code>                | <code>+ offset</code>  | <i>Remarks:</i> With <code>ql = p + o;</code> , then: <code>ql - o == p</code>                                                                                                                                                                                                                                                                                                                           |
| <code>p1 += o</code> | <code>P&amp;</code>           | <code>+= offset</code> | <i>Remarks:</i> With <code>ql = p1;</code> before the <code>+=</code> , then: <code>p1 - o == ql</code>                                                                                                                                                                                                                                                                                                  |
| <code>p - o</code>   | <code>P</code>                | <code>- offset</code>  | <i>Remarks:</i> With <code>ql = p - o;</code> , then: <code>ql + o == p</code>                                                                                                                                                                                                                                                                                                                           |
| <code>p1 -= o</code> | <code>P&amp;</code>           | <code>-= offset</code> | <i>Remarks:</i> With <code>ql = p1;</code> before the <code>-=</code> , then: <code>p1 + o == ql</code>                                                                                                                                                                                                                                                                                                  |
| <code>o + p</code>   | convertible to <code>P</code> | <code>p + o</code>     | <code>P(o + p) == p + o</code>                                                                                                                                                                                                                                                                                                                                                                           |
| <code>p - q</code>   | <code>streamoff</code>        | distance               | <code>p == q + (p - q)</code>                                                                                                                                                                                                                                                                                                                                                                            |

Stream operations that return a value of type `traits::pos_type` return `P(0(-1))` as an invalid value to signal an error. If this value is used as an argument to any `istream`, `ostream`, or `streambuf` member that accepts a value of type `traits::pos_type` then the behavior of that function is undefined.

### 31.5.4 Class template `basic_ios`

[ios]

#### 31.5.4.1 Overview

[ios.overview]

```

namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_ios : public ios_base {
    public:
        using char_type    = charT;
        using int_type      = typename traits::int_type;
        using pos_type      = typename traits::pos_type;
        using off_type      = typename traits::off_type;
        using traits_type    = traits;

        // 31.5.4.4, flags functions
        explicit operator bool() const;
        bool operator!() const;
        iostate rdstate() const;
        void clear(iostate state = goodbit);
        void setstate(iostate state);
        bool good() const;
        bool eof() const;
        bool fail() const;
        bool bad() const;

        iostate exceptions() const;
        void exceptions(iostate except);

        // 31.5.4.2, constructor/destructor
        explicit basic_ios(basic_streambuf<charT, traits>* sb);
        virtual ~basic_ios();

        basic_ostream<charT, traits>* tie() const;
        basic_ostream<charT, traits>* tie(basic_ostream<charT, traits>* tiestr);
    
```

```

basic_streambuf<charT, traits>* rdbuf() const;
basic_streambuf<charT, traits>* rdbuf(basic_streambuf<charT, traits>* sb);

basic_ios& copyfmt(const basic_ios& rhs);

char_type fill() const;
char_type fill(char_type ch);

locale imbue(const locale& loc);

char        narrow(char_type c, char dfault) const;
char_type widen(char c) const;

basic_ios(const basic_ios&) = delete;
basic_ios& operator=(const basic_ios&) = delete;

protected:
    basic_ios();
    void init(basic_streambuf<charT, traits>* sb);
    void move(basic_ios& rhs);
    void move(basic_ios&& rhs);
    void swap(basic_ios& rhs) noexcept;
    void set_rdbuf(basic_streambuf<charT, traits>* sb);
};
}

```

#### 31.5.4.2 Constructors

[basic.ios.cons]

explicit basic\_ios(basic\_streambuf<charT, traits>\* sb);

*Effects:* Assigns initial values to its member objects by calling `init(sb)`.

basic\_ios();

*Effects:* Leaves its member objects uninitialized. The object shall be initialized by calling `basic_ios::init` before its first use or before it is destroyed, whichever comes first; otherwise the behavior is undefined.

~basic\_ios();

*Remarks:* The destructor does not destroy `rdbuf()`.

void init(basic\_streambuf<charT, traits>\* sb);

*Postconditions:* The postconditions of this function are indicated in [Table 124](#).

**Table 124** — `basic_ios::init()` effects [tab:basic.ios.cons]

| Element                   | Value                                                                                          |
|---------------------------|------------------------------------------------------------------------------------------------|
| <code>rdbuf()</code>      | <code>sb</code>                                                                                |
| <code>tie()</code>        | <code>0</code>                                                                                 |
| <code>rdstate()</code>    | <code>goodbit</code> if <code>sb</code> is not a null pointer, otherwise <code>badbit</code> . |
| <code>exceptions()</code> | <code>goodbit</code>                                                                           |
| <code>flags()</code>      | <code>skipws   dec</code>                                                                      |
| <code>width()</code>      | <code>0</code>                                                                                 |
| <code>precision()</code>  | <code>6</code>                                                                                 |
| <code>fill()</code>       | <code>widen(' ')</code>                                                                        |
| <code>getloc()</code>     | a copy of the value returned by <code>locale()</code>                                          |
| <i>iarray</i>             | a null pointer                                                                                 |
| <i>parray</i>             | a null pointer                                                                                 |

## 31.5.4.3 Member functions

[basic.ios.members]

```
basic_ostream<charT, traits>* tie() const;
```

*Returns:* An output sequence that is *tied* to (synchronized with) the sequence controlled by the stream buffer.

```
basic_ostream<charT, traits>* tie(basic_ostream<charT, traits>* tiestr);
```

*Preconditions:* If *tiestr* is not null, *tiestr* is not reachable by traversing the linked list of tied stream objects starting from *tiestr->tie()*.

*Postconditions:* *tiestr == tie()*.

*Returns:* The previous value of *tie()*.

```
basic_streambuf<charT, traits>* rdbuf() const;
```

*Returns:* A pointer to the *streambuf* associated with the stream.

```
basic_streambuf<charT, traits>* rdbuf(basic_streambuf<charT, traits>* sb);
```

*Effects:* Calls *clear()*.

*Postconditions:* *sb == rdbuf()*.

*Returns:* The previous value of *rdbuf()*.

```
locale imbue(const locale& loc);
```

*Effects:* Calls *ios\_base::imbue(loc)* (31.5.2.4) and if *rdbuf() != 0* then *rdbuf()->pubimbue(loc)* (31.6.3.3.1).

*Returns:* The prior value of *ios\_base::imbue()*.

```
char narrow(char_type c, char dfault) const;
```

*Returns:* *use\_facet<ctype<char\_type>>(getloc()).narrow(c, dfault)*

```
char_type widen(char c) const;
```

*Returns:* *use\_facet<ctype<char\_type>>(getloc()).widen(c)*

```
char_type fill() const;
```

*Returns:* The character used to pad (fill) an output conversion to the specified field width.

```
char_type fill(char_type fillch);
```

*Postconditions:* *traits::eq(fillch, fill())*.

*Returns:* The previous value of *fill()*.

```
basic_ios& copyfmt(const basic_ios& rhs);
```

*Effects:* If *(this == addressof(rhs))* is *true* does nothing. Otherwise assigns to the member objects of *\*this* the corresponding member objects of *rhs* as follows:

- calls each registered callback pair *(fn, idx)* as *(\*fn)(erase\_event, \*this, idx)*;
- then, assigns to the member objects of *\*this* the corresponding member objects of *rhs*, except that
  - *rdstate()*, *rdbuf()*, and *exceptions()* are left unchanged;
  - the contents of arrays pointed at by *pword* and *iword* are copied, not the pointers themselves;<sup>273</sup> and
  - if any newly stored pointer values in *\*this* point at objects stored outside the object *rhs* and those objects are destroyed when *rhs* is destroyed, the newly stored pointer values are altered to point at newly constructed copies of the objects;
- then, calls each callback pair that was copied from *rhs* as *(\*fn)(copyfmt\_event, \*this, idx)*;
- then, calls *exceptions(rhs.exceptions())*.

<sup>273</sup>) This suggests an infinite amount of copying, but the implementation can keep track of the maximum element of the arrays that is nonzero.

NOTE The second pass through the callback pairs permits a copied `pword` value to be zeroed, or to have its referent deep copied or reference counted, or to have other special action taken.

*Postconditions:* The postconditions of this function are indicated in Table 125.

Table 125 — `basic_ios::copyfmt()` effects [tab:basic.ios.copyfmt]

| Element                   | Value                         |
|---------------------------|-------------------------------|
| <code>rdbuf()</code>      | <i>unchanged</i>              |
| <code>tie()</code>        | <code>rhs.tie()</code>        |
| <code>rdstate()</code>    | <i>unchanged</i>              |
| <code>exceptions()</code> | <code>rhs.exceptions()</code> |
| <code>flags()</code>      | <code>rhs.flags()</code>      |
| <code>width()</code>      | <code>rhs.width()</code>      |
| <code>precision()</code>  | <code>rhs.precision()</code>  |
| <code>fill()</code>       | <code>rhs.fill()</code>       |
| <code>getloc()</code>     | <code>rhs.getloc()</code>     |

*Returns:* `*this`.

```
void move(basic_ios& rhs);
void move(basic_ios&& rhs);
```

*Postconditions:* `*this` has the state that `rhs` had before the function call, except that `rdbuf()` returns `nullptr`. `rhs` is in a valid but unspecified state, except that `rhs.rdbuf()` returns the same value as it returned before the function call, and `rhs.tie()` returns `nullptr`.

```
void swap(basic_ios& rhs) noexcept;
```

*Effects:* The states of `*this` and `rhs` are exchanged, except that `rdbuf()` returns the same value as it returned before the function call, and `rhs.rdbuf()` returns the same value as it returned before the function call.

```
void set_rdbuf(basic_streambuf<charT, traits>*sb);
```

*Preconditions:* `sb != nullptr` is true.

*Effects:* Associates the `basic_streambuf` object pointed to by `sb` with this stream without calling `clear()`.

*Postconditions:* `rdbuf() == sb` is true.

*Throws:* Nothing.

#### 31.5.4.4 Flags functions

[iostate.flags]

```
explicit operator bool() const;
```

*Returns:* `!fail()`.

```
bool operator!() const;
```

*Returns:* `fail()`.

```
iostate rdstate() const;
```

*Returns:* The error state of the stream buffer.

```
void clear(iostate state = goodbit);
```

*Effects:* If `((state | (rdbuf() ? goodbit : badbit)) & exceptions()) == 0`, returns. Otherwise, the function throws an object of class `ios_base::failure` (31.5.2.2.1), constructed with implementation-defined argument values.

*Postconditions:* If `rdbuf() != 0` then `state == rdstate()`; otherwise `rdstate() == (state | ios_base::badbit)`.

```
void setstate(iostate state);
```

*Effects:* Calls `clear(rdstate() | state)` (which may throw `ios_base::failure` (31.5.2.2.1)).

`bool good() const;`

*Returns:* `rdstate() == 0`

`bool eof() const;`

*Returns:* true if eofbit is set in `rdstate()`.

`bool fail() const;`

*Returns:* true if failbit or badbit is set in `rdstate()`.<sup>274</sup>

`bool bad() const;`

*Returns:* true if badbit is set in `rdstate()`.

`iostate exceptions() const;`

*Returns:* A mask that determines what elements set in `rdstate()` cause exceptions to be thrown.

`void exceptions(iostate except);`

*Effects:* Calls `clear(rdstate())`.

*Postconditions:* `except == exceptions()`.

### 31.5.5 `ios_base` manipulators

[std.ios.manip]

#### 31.5.5.1 `fmtflags` manipulators

[fmtflags.manip]

Each function specified in this subclause is a designated addressable function (16.4.5.2.1).

`ios_base& boolalpha(ios_base& str);`

*Effects:* Calls `str.setf(ios_base::boolalpha)`.

*Returns:* `str`.

`ios_base& noboolalpha(ios_base& str);`

*Effects:* Calls `str.unsetf(ios_base::boolalpha)`.

*Returns:* `str`.

`ios_base& showbase(ios_base& str);`

*Effects:* Calls `str.setf(ios_base::showbase)`.

*Returns:* `str`.

`ios_base& noshowbase(ios_base& str);`

*Effects:* Calls `str.unsetf(ios_base::showbase)`.

*Returns:* `str`.

`ios_base& showpoint(ios_base& str);`

*Effects:* Calls `str.setf(ios_base::showpoint)`.

*Returns:* `str`.

`ios_base& noshowpoint(ios_base& str);`

*Effects:* Calls `str.unsetf(ios_base::showpoint)`.

*Returns:* `str`.

`ios_base& showpos(ios_base& str);`

*Effects:* Calls `str.setf(ios_base::showpos)`.

*Returns:* `str`.

`ios_base& noshowpos(ios_base& str);`

*Effects:* Calls `str.unsetf(ios_base::showpos)`.

<sup>274</sup>) Checking `badbit` also for `fail()` is historical practice.

*Returns:* `str`.

`ios_base& skipws(ios_base& str);`

*Effects:* Calls `str.setf(ios_base::skipws)`.

*Returns:* `str`.

`ios_base& noskipws(ios_base& str);`

*Effects:* Calls `str.unsetf(ios_base::skipws)`.

*Returns:* `str`.

`ios_base& uppercase(ios_base& str);`

*Effects:* Calls `str.setf(ios_base::uppercase)`.

*Returns:* `str`.

`ios_base& nouppercase(ios_base& str);`

*Effects:* Calls `str.unsetf(ios_base::uppercase)`.

*Returns:* `str`.

`ios_base& unitbuf(ios_base& str);`

*Effects:* Calls `str.setf(ios_base::unitbuf)`.

*Returns:* `str`.

`ios_base& nouunitbuf(ios_base& str);`

*Effects:* Calls `str.unsetf(ios_base::unitbuf)`.

*Returns:* `str`.

### 31.5.5.2 adjustfield manipulators

[adjustfield.manip]

Each function specified in this subclause is a designated addressable function (16.4.5.2.1).

`ios_base& internal(ios_base& str);`

*Effects:* Calls `str.setf(ios_base::internal, ios_base::adjustfield)`.

*Returns:* `str`.

`ios_base& left(ios_base& str);`

*Effects:* Calls `str.setf(ios_base::left, ios_base::adjustfield)`.

*Returns:* `str`.

`ios_base& right(ios_base& str);`

*Effects:* Calls `str.setf(ios_base::right, ios_base::adjustfield)`.

*Returns:* `str`.

### 31.5.5.3 basefield manipulators

[basefield.manip]

Each function specified in this subclause is a designated addressable function (16.4.5.2.1).

`ios_base& dec(ios_base& str);`

*Effects:* Calls `str.setf(ios_base::dec, ios_base::basefield)`.

*Returns:* `str`.<sup>275</sup>

`ios_base& hex(ios_base& str);`

*Effects:* Calls `str.setf(ios_base::hex, ios_base::basefield)`.

*Returns:* `str`.

<sup>275</sup>) The function signature `dec(ios_base&)` can be called by the function signature `basic_ostream& stream::operator<<(ios_base& (*)(ios_base&))` to permit expressions of the form `cout << dec` to change the format flags stored in `cout`.

```
ios_base& oct(ios_base& str);
```

*Effects:* Calls `str.setf(ios_base::oct, ios_base::basefield)`.

*Returns:* `str`.

#### 31.5.5.4 floatfield manipulators

[floatfield.manip]

Each function specified in this subclause is a designated addressable function (16.4.5.2.1).

```
ios_base& fixed(ios_base& str);
```

*Effects:* Calls `str.setf(ios_base::fixed, ios_base::floatfield)`.

*Returns:* `str`.

```
ios_base& scientific(ios_base& str);
```

*Effects:* Calls `str.setf(ios_base::scientific, ios_base::floatfield)`.

*Returns:* `str`.

```
ios_base& hexfloat(ios_base& str);
```

*Effects:* Calls `str.setf(ios_base::fixed | ios_base::scientific, ios_base::floatfield)`.

*Returns:* `str`.

NOTE It is not possible to use `ios_base::hex` to specify a hexadecimal floating-point format, because it is not part of `ios_base::floatfield` (Table 119).

```
ios_base& defaultfloat(ios_base& str);
```

*Effects:* Calls `str.unsetf(ios_base::floatfield)`.

*Returns:* `str`.

#### 31.5.6 Error reporting

[error.reporting]

```
error_code make_error_code(io_errc e) noexcept;
```

*Returns:* `error_code(static_cast<int>(e), iostream_category())`.

```
error_condition make_error_condition(io_errc e) noexcept;
```

*Returns:* `error_condition(static_cast<int>(e), iostream_category())`.

```
const error_category& iostream_category() noexcept;
```

*Returns:* A reference to an object of a type derived from class `error_category`.

The object's default `error_condition` and equivalent virtual functions shall behave as specified for the class `error_category`. The object's `name` virtual function shall return a pointer to the string "iostream".

### 31.6 Stream buffers

[stream.buffer]

#### 31.6.1 Header <streambuf> synopsis

[streambuf.syn]

```
namespace std {
    template<class charT, class traits = char_traits<charT>>
        class basic_streambuf;
    using streambuf = basic_streambuf<char>;
    using wstreambuf = basic_streambuf<wchar_t>;
}
```

The header <streambuf> defines types that control input from and output to *character* sequences.

#### 31.6.2 Stream buffer requirements

[streambuf.reqts]

Stream buffers can impose various constraints on the sequences they control. Some constraints are:

- The controlled input sequence can be not readable.
- The controlled output sequence can be not writable.
- The controlled sequences can be associated with the contents of other representations for character sequences, such as external files.

- The controlled sequences can support operations *directly* to or from associated sequences.
- The controlled sequences can impose limitations on how the program can read characters from a sequence, write characters to a sequence, put characters back into an input sequence, or alter the stream position.

Each sequence is characterized by three pointers which, if non-null, all point into the same `charT` array object. The array object represents, at any moment, a (sub)sequence of characters from the sequence. Operations performed on a sequence alter the values stored in these pointers, perform reads and writes directly to or from associated sequences, and alter “the stream position” and conversion state as needed to maintain this subsequence relationship. The three pointers are:

- the *beginning pointer*, or lowest element address in the array (called `xbeg` here);
- the *next pointer*, or next element address that is a current candidate for reading or writing (called `xnext` here);
- the *end pointer*, or first element address beyond the end of the array (called `xend` here).

The following semantic constraints shall always apply for any set of three pointers for a sequence, using the pointer names given immediately above:

- If `xnext` is not a null pointer, then `xbeg` and `xend` shall also be non-null pointers into the same `charT` array, as described above; otherwise, `xbeg` and `xend` shall also be null.
- If `xnext` is not a null pointer and `xnext < xend` for an output sequence, then a *write position* is available. In this case, `*xnext` shall be assignable as the next element to write (to put, or to store a character value, into the sequence).
- If `xnext` is not a null pointer and `xbeg < xnext` for an input sequence, then a *putback position* is available. In this case, `xnext[-1]` shall have a defined value and is the next (preceding) element to store a character that is put back into the input sequence.
- If `xnext` is not a null pointer and `xnext < xend` for an input sequence, then a *read position* is available. In this case, `*xnext` shall have a defined value and is the next element to read (to get, or to obtain a character value, from the sequence).

### 31.6.3 Class template `basic_streambuf`

[streambuf]

#### 31.6.3.1 General

[streambuf.general]

```
namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_streambuf {
    public:
        using char_type    = charT;
        using int_type      = typename traits::int_type;
        using pos_type      = typename traits::pos_type;
        using off_type      = typename traits::off_type;
        using traits_type   = traits;

        virtual ~basic_streambuf();

        // 31.6.3.3.1, locales
        locale pubimbue(const locale& loc);
        locale getloc() const;

        // 31.6.3.3.2, buffer and positioning
        basic_streambuf* pubsetbuf(char_type* s, streamsize n);
        pos_type pubseekoff(off_type off, ios_base::seekdir way,
                           ios_base::openmode which
                           = ios_base::in | ios_base::out);
        pos_type pubseekpos(pos_type sp,
                           ios_base::openmode which
                           = ios_base::in | ios_base::out);
        int pubsync();
    };
}
```

```

// get and put areas
// 31.6.3.3.3, get area
streamsize in_avail();
int_type snextc();
int_type sbumpc();
int_type sgetc();
streamsize sgetn(char_type* s, streamsize n);

// 31.6.3.3.4, putback
int_type sputbackc(char_type c);
int_type sungetc();

// 31.6.3.3.5, put area
int_type sputc(char_type c);
streamsize sputn(const char_type* s, streamsize n);

protected:
basic_streambuf();
basic_streambuf(const basic_streambuf& rhs);
basic_streambuf& operator=(const basic_streambuf& rhs);

void swap(basic_streambuf& rhs);

// 31.6.3.4.2, get area access
char_type* eback() const;
char_type* gptr() const;
char_type* egptr() const;
void gbump(int n);
void setg(char_type* gbeg, char_type* gnext, char_type* gend);

// 31.6.3.4.3, put area access
char_type* pbase() const;
char_type* pptr() const;
char_type* ep_ptr() const;
void pbump(int n);
void setp(char_type* pbeg, char_type* pend);

// 31.6.3.5, virtual functions
// 31.6.3.5.1, locales
virtual void imbue(const locale& loc);

// 31.6.3.5.2, buffer management and positioning
virtual basic_streambuf* setbuf(char_type* s, streamsize n);
virtual pos_type seekoff(off_type off, ios_base::seekdir way,
                        ios_base::openmode which
                        = ios_base::in | ios_base::out);
virtual pos_type seekpos(pos_type sp,
                        ios_base::openmode which
                        = ios_base::in | ios_base::out);
virtual int sync();

// 31.6.3.5.3, get area
virtual streamsize showmanyc();
virtual streamsize xsgetn(char_type* s, streamsize n);
virtual int_type underflow();
virtual int_type uflow();

// 31.6.3.5.4, putback
virtual int_type pbackfail(int_type c = traits::eof());

// 31.6.3.5.5, put area
virtual streamsize xsputn(const char_type* s, streamsize n);
virtual int_type overflow(int_type c = traits::eof());

```

```
};
}
```

The class template `basic_streambuf` serves as an abstract base class for deriving various *stream buffers* whose objects each control two *character sequences*:

- a character *input sequence*;
- a character *output sequence*.

### 31.6.3.2 Constructors

[streambuf.cons]

```
basic_streambuf();
```

*Effects:* Initializes:<sup>276</sup>

- all pointer member objects to null pointers,
- the `getloc()` member to a copy of the global locale, `locale()`, at the time of construction.

*Remarks:* Once the `getloc()` member is initialized, results of calling locale member functions, and of members of facets so obtained, can safely be cached until the next time the member `imbue` is called.

```
basic_streambuf(const basic_streambuf& rhs);
```

*Postconditions:*

- `eback() == rhs.eback()`
- `gptr() == rhs.gptr()`
- `egptr() == rhs.egptr()`
- `pbase() == rhs.pbase()`
- `pptr() == rhs.pptr()`
- `epptr() == rhs.epptr()`
- `getloc() == rhs.getloc()`

```
~basic_streambuf();
```

*Effects:* None.

### 31.6.3.3 Public member functions

[streambuf.members]

#### 31.6.3.3.1 Locales

[streambuf.locales]

```
locale pubimbue(const locale& loc);
```

*Effects:* Calls `imbue(loc)`.

*Postconditions:* `loc == getloc()`.

*Returns:* Previous value of `getloc()`.

```
locale getloc() const;
```

*Returns:* If `pubimbue()` has ever been called, then the last value of `loc` supplied, otherwise the current global locale, `locale()`, in effect at the time of construction. If called after `pubimbue()` has been called but before `pubimbue` has returned (i.e., from within the call of `imbue()`) then it returns the previous value.

#### 31.6.3.3.2 Buffer management and positioning

[streambuf.buffer]

```
basic_streambuf* pubsetbuf(char_type* s, streamsize n);
```

*Returns:* `setbuf(s, n)`.

```
pos_type pubseekoff(off_type off, ios_base::seekdir way,
ios_base::openmode which
= ios_base::in | ios_base::out);
```

*Returns:* `seekoff(off, way, which)`.

<sup>276</sup>) The default constructor is protected for class `basic_streambuf` to assure that only objects for classes derived from this class can be constructed.

```
pos_type pubseekpos(pos_type sp,
                    ios_base::openmode which
                    = ios_base::in | ios_base::out);
```

*Returns:* seekpos(sp, which).

```
int pubsync();
```

*Returns:* sync().

### 31.6.3.3.3 Get area

[streambuf.pub.get]

```
streamsize in_avail();
```

*Returns:* If a read position is available, returns `egptr() - gptr()`. Otherwise returns `showmanyc()` (31.6.3.5.3).

```
int_type snextc();
```

*Effects:* Calls `sbumpc()`.

*Returns:* If that function returns `traits::eof()`, returns `traits::eof()`. Otherwise, returns `sgetc()`.

```
int_type sbumpc();
```

*Effects:* If the input sequence read position is not available, returns `underflow()`. Otherwise, returns `traits::to_int_type(*gptr())` and increments the next pointer for the input sequence.

```
int_type sgetc();
```

*Returns:* If the input sequence read position is not available, returns `underflow()`. Otherwise, returns `traits::to_int_type(*gptr())`.

```
streamsize sgetn(char_type* s, streamsize n);
```

*Returns:* `xsgetn(s, n)`.

### 31.6.3.3.4 Putback

[streambuf.pub.pback]

```
int_type sputbackc(char_type c);
```

*Effects:* If the input sequence putback position is not available, or if `traits::eq(c, gptr()[-1])` is false, returns `pbackfail(traits::to_int_type(c))`. Otherwise, decrements the next pointer for the input sequence and returns `traits::to_int_type(*gptr())`.

```
int_type sungetc();
```

*Effects:* If the input sequence putback position is not available, returns `pbackfail()`. Otherwise, decrements the next pointer for the input sequence and returns `traits::to_int_type(*gptr())`.

### 31.6.3.3.5 Put area

[streambuf.pub.put]

```
int_type sputc(char_type c);
```

*Effects:* If the output sequence write position is not available, returns `overflow(traits::to_int_type(c))`. Otherwise, stores `c` at the next pointer for the output sequence, increments the pointer, and returns `traits::to_int_type(c)`.

```
streamsize sputn(const char_type* s, streamsize n);
```

*Returns:* `xspun(s, n)`.

### 31.6.3.4 Protected member functions

[streambuf.protected]

#### 31.6.3.4.1 Assignment

[streambuf.assign]

```
basic_streambuf& operator=(const basic_streambuf& rhs);
```

*Postconditions:*

- `eback() == rhs.eback()`
- `gptr() == rhs.gptr()`
- `egptr() == rhs.egptr()`

— pbase() == rhs.pbase()  
 — pptr() == rhs.pptr()  
 — epptr() == rhs.epptr()  
 — getloc() == rhs.getloc()

*Returns:* \*this.

void swap(basic\_streambuf& rhs);

*Effects:* Swaps the data members of rhs and \*this.

#### 31.6.3.4.2 Get area access

[streambuf.get.area]

char\_type\* eback() const;

*Returns:* The beginning pointer for the input sequence.

char\_type\* gptr() const;

*Returns:* The next pointer for the input sequence.

char\_type\* egptr() const;

*Returns:* The end pointer for the input sequence.

void gbump(int n);

*Effects:* Adds n to the next pointer for the input sequence.

void setg(char\_type\* gbeg, char\_type\* gnext, char\_type\* gend);

*Postconditions:* gbeg == eback(), gnext == gptr(), and gend == egptr() are all true.

#### 31.6.3.4.3 Put area access

[streambuf.put.area]

char\_type\* pbase() const;

*Returns:* The beginning pointer for the output sequence.

char\_type\* pptr() const;

*Returns:* The next pointer for the output sequence.

char\_type\* epptr() const;

*Returns:* The end pointer for the output sequence.

void pbump(int n);

*Effects:* Adds n to the next pointer for the output sequence.

void setp(char\_type\* pbeg, char\_type\* pend);

*Postconditions:* pbeg == pbase(), pbeg == pptr(), and pend == epptr() are all true.

#### 31.6.3.5 Virtual functions

[streambuf.virtuals]

##### 31.6.3.5.1 Locales

[streambuf.virt.locales]

void imbue(const locale&);

*Effects:* Change any translations based on locale.

*Remarks:* Allows the derived class to be informed of changes in locale at the time they occur. Between invocations of this function a class derived from streambuf can safely cache results of calls to locale functions and to members of facets so obtained.

*Default behavior:* Does nothing.

##### 31.6.3.5.2 Buffer management and positioning

[streambuf.virt.buffer]

basic\_streambuf\* setbuf(char\_type\* s, streamsize n);

*Effects:* Influences stream buffering in a way that is defined separately for each class derived from basic\_streambuf in this Clause (31.8.2.5, 31.10.2.5).

*Default behavior:* Does nothing. Returns *this*.

```
pos_type seekoff(off_type off, ios_base::seekdir way,
                ios_base::openmode which
                = ios_base::in | ios_base::out);
```

*Effects:* Alters the stream positions within one or more of the controlled sequences in a way that is defined separately for each class derived from `basic_streambuf` in this Clause (31.8.2.5, 31.10.2.5).

*Default behavior:* Returns `pos_type(off_type(-1))`.

```
pos_type seekpos(pos_type sp,
                ios_base::openmode which
                = ios_base::in | ios_base::out);
```

*Effects:* Alters the stream positions within one or more of the controlled sequences in a way that is defined separately for each class derived from `basic_streambuf` in this Clause (31.8.2, 31.10.2).

*Default behavior:* Returns `pos_type(off_type(-1))`.

```
int sync();
```

*Effects:* Synchronizes the controlled sequences with the arrays. That is, if `pbase()` is non-null the characters between `pbase()` and `pptr()` are written to the controlled sequence. The pointers may then be reset as appropriate.

*Returns:* `-1` on failure. What constitutes failure is determined by each derived class (31.10.2.5).

*Default behavior:* Returns zero.

### 31.6.3.5.3 Get area

[`streambuf.virt.get`]

```
streamsize showmanyc();277
```

*Returns:* An estimate of the number of characters available in the sequence, or `-1`. If it returns a positive value, then successive calls to `underflow()` will not return `traits::eof()` until at least that number of characters have been extracted from the stream. If `showmanyc()` returns `-1`, then calls to `underflow()` or `uflow()` will fail.<sup>278</sup>

*Default behavior:* Returns zero.

*Remarks:* Uses `traits::eof()`.

```
streamsize xsgetn(char_type* s, streamsize n);
```

*Effects:* Assigns up to `n` characters to successive elements of the array whose first element is designated by `s`. The characters assigned are read from the input sequence as if by repeated calls to `sbumpc()`. Assigning stops when either `n` characters have been assigned or a call to `sbumpc()` would return `traits::eof()`.

*Returns:* The number of characters assigned.<sup>279</sup>

*Remarks:* Uses `traits::eof()`.

```
int_type underflow();
```

The *pending sequence* of characters is defined as the concatenation of

- the empty sequence if `gptr()` is null, otherwise the characters in `[gptr(), egptr())`, followed by
- some (possibly empty) sequence of characters read from the input sequence.

The *result character* is the first character of the pending sequence if it is non-empty, otherwise the next character that would be read from the input sequence.

The *backup sequence* is the empty sequence if `eback()` is null, otherwise the characters in `[eback(), gptr())`.

<sup>277</sup>) The morphemes of `showmanyc` are “es-how-many-see”, not “show-manic”.

<sup>278</sup>) `underflow` or `uflow` can fail by throwing an exception prematurely. The intention is not only that the calls will not return `eof()` but that they will return “immediately”.

<sup>279</sup>) Classes derived from `basic_streambuf` can provide more efficient ways to implement `xsgetn()` and `xsputn()` by overriding these definitions from the base class.

*Effects:* The function sets up the `gptr()` and `egptr()` such that if the pending sequence is non-empty, then `egptr()` is non-null and the characters in `[gptr(), egptr())` are the characters in the pending sequence, otherwise either `gptr()` is null or `gptr() == egptr()`.

If `eback()` and `gptr()` are non-null then the function is not constrained as to their contents, but the “usual backup condition” is that either

- the backup sequence contains at least `gptr() - eback()` characters, in which case the characters in `[eback(), gptr())` agree with the last `gptr() - eback()` characters of the backup sequence, or
- the characters in `[gptr() - n, gptr())` agree with the backup sequence (where `n` is the length of the backup sequence).

*Returns:* `traits::to_int_type(c)`, where `c` is the first character of the pending sequence, without moving the input sequence position past it. If the pending sequence is null then the function returns `traits::eof()` to indicate failure.

*Default behavior:* Returns `traits::eof()`.

*Remarks:* The public members of `basic_streambuf` call this virtual function only if `gptr()` is null or `gptr() >= egptr()`.

```
int_type uflow();
```

*Preconditions:* The constraints are the same as for `underflow()`, except that the result character is transferred from the pending sequence to the backup sequence, and the pending sequence is not empty before the transfer.

*Default behavior:* Calls `underflow()`. If `underflow()` returns `traits::eof()`, returns `traits::eof()`. Otherwise, returns the value of `traits::to_int_type(*gptr())` and increments the value of the next pointer for the input sequence.

*Returns:* `traits::eof()` to indicate failure.

#### 31.6.3.5.4 Putback

[`streambuf.virt.pback`]

```
int_type pbackfail(int_type c = traits::eof());
```

The pending sequence is defined as for `underflow()`, with the modifications that

- If `traits::eq_int_type(c, traits::eof())` returns `true`, then the input sequence is backed up one character before the pending sequence is determined.
- If `traits::eq_int_type(c, traits::eof())` returns `false`, then `c` is prepended. Whether the input sequence is backed up or modified in any other way is unspecified.

*Postconditions:* On return, the constraints of `gptr()`, `eback()`, and `pptr()` are the same as for `underflow()`.

*Returns:* `traits::eof()` to indicate failure. Failure may occur because the input sequence cannot be backed up, or if for some other reason the pointers cannot be set consistent with the constraints. `pbackfail()` is called only when put back has really failed.

Returns some value other than `traits::eof()` to indicate success.

*Default behavior:* Returns `traits::eof()`.

*Remarks:* The public functions of `basic_streambuf` call this virtual function only when `gptr()` is null, `gptr() == eback()`, or `traits::eq(traits::to_char_type(c), gptr()[-1])` returns `false`. Other calls shall also satisfy that constraint.

#### 31.6.3.5.5 Put area

[`streambuf.virt.put`]

```
streamsize xsputn(const char_type* s, streamsize n);
```

*Effects:* Writes up to `n` characters to the output sequence as if by repeated calls to `sputc(c)`. The characters written are obtained from successive elements of the array whose first element is designated by `s`. Writing stops when either `n` characters have been written or a call to `sputc(c)` would return `traits::eof()`. It is unspecified whether the function calls `overflow()` when `pptr() == epptr()` becomes `true` or whether it achieves the same effects by other means.

*Returns:* The number of characters written.

```
int_type overflow(int_type c = traits::eof());
```

*Effects:* Consumes some initial subsequence of the characters of the *pending sequence*. The pending sequence is defined as the concatenation of

- the empty sequence if `pbase()` is null, otherwise the `pptr() - pbase()` characters beginning at `pbase()`, followed by
- the empty sequence if `traits::eq_int_type(c, traits::eof())` returns `true`, otherwise the sequence consisting of `c`.

*Preconditions:* Every overriding definition of this virtual function obeys the following constraints:

- The effect of consuming a character on the associated output sequence is specified.<sup>280</sup>
- Let `r` be the number of characters in the pending sequence not consumed. If `r` is nonzero then `pbase()` and `pptr()` are set so that: `pptr() - pbase() == r` and the `r` characters starting at `pbase()` are the associated output stream. In case `r` is zero (all characters of the pending sequence have been consumed) then either `pbase()` is set to `nullptr`, or `pbase()` and `pptr()` are both set to the same non-null value.
- The function may fail if either appending some character to the associated output stream fails or if it is unable to establish `pbase()` and `pptr()` according to the above rules.

*Returns:* `traits::eof()` or throws an exception if the function fails.

Otherwise, returns some value other than `traits::eof()` to indicate success.<sup>281</sup>

*Default behavior:* Returns `traits::eof()`.

*Remarks:* The member functions `sputc()` and `sputn()` call this function in case that no room can be found in the put buffer enough to accommodate the argument character sequence.

## 31.7 Formatting and manipulators

[`iostream.format`]

### 31.7.1 Header `<istream>` synopsis

[`istream.syn`]

```
namespace std {
    template<class charT, class traits = char_traits<charT>>
        class basic_istream;

    using istream = basic_istream<char>;
    using wistream = basic_istream<wchar_t>;

    template<class charT, class traits = char_traits<charT>>
        class basic_iostream;

    using istream = basic_iostream<char>;
    using wiostream = basic_iostream<wchar_t>;

    template<class charT, class traits>
        basic_istream<charT, traits>& ws(basic_istream<charT, traits>& is);

    template<class Istream, class T>
        Istream&& operator>>(Istream&& is, T&& x);
}
```

### 31.7.2 Header `<ostream>` synopsis

[`ostream.syn`]

```
namespace std {
    template<class charT, class traits = char_traits<charT>>
        class basic_ostream;

    using ostream = basic_ostream<char>;
    using wostream = basic_ostream<wchar_t>;
```

<sup>280</sup>) That is, for each class derived from a specialization of `basic_streambuf` in this Clause (31.8.2, 31.10.2), a specification of how consuming a character effects the associated output sequence is given. There is no requirement on a program-defined class.

<sup>281</sup>) Typically, `overflow` returns `c` to indicate success, except when `traits::eq_int_type(c, traits::eof())` returns `true`, in which case it returns `traits::not_eof(c)`.

```

template<class charT, class traits>
    basic_ostream<charT, traits>& endl(basic_ostream<charT, traits>& os);

}

```

### 31.7.5 Input streams

[input.streams]

#### 31.7.5.1 General

[input.streams.general]

The header `<istream>` defines two class templates and a function template that control input from a stream buffer, along with a function template that extracts from stream rvalues.

#### 31.7.5.2 Class template `basic_istream`

[istream]

##### 31.7.5.2.1 General

[istream.general]

When a function is specified with a type placeholder of *extended-floating-point-type*, the implementation provides overloads for all cv-unqualified extended floating-point types (6.8.2) in lieu of *extended-floating-point-type*.

```

namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_istream : virtual public basic_ios<charT, traits> {
    public:
        // types (inherited from basic_ios (31.5.4))
        using char_type = charT;
        using int_type = typename traits::int_type;
        using pos_type = typename traits::pos_type;
        using off_type = typename traits::off_type;
        using traits_type = traits;

        // 31.7.5.2.2, constructor/destructor
        explicit basic_istream(basic_streambuf<charT, traits>* sb);
        virtual ~basic_istream();

        // 31.7.5.2.4, prefix/suffix
        class sentry;

        // 31.7.5.3, formatted input
        basic_istream& operator>>(basic_istream& (*pf)(basic_istream&));
        basic_istream& operator>>(basic_ios<charT, traits>& (*pf)(basic_ios<charT, traits>&));
        basic_istream& operator>>(ios_base& (*pf)(ios_base&));

        basic_istream& operator>>(bool& n);
        basic_istream& operator>>(short& n);
        basic_istream& operator>>(unsigned short& n);
        basic_istream& operator>>(int& n);
        basic_istream& operator>>(unsigned int& n);
        basic_istream& operator>>(long& n);
        basic_istream& operator>>(unsigned long& n);
        basic_istream& operator>>(long long& n);
        basic_istream& operator>>(unsigned long long& n);
        basic_istream& operator>>(float& f);
        basic_istream& operator>>(double& f);
        basic_istream& operator>>(long double& f);
        basic_istream& operator>>(extended-floating-point-type& f);

        basic_istream& operator>>(void*& p);
        basic_istream& operator>>(basic_streambuf<char_type, traits>* sb);
    };
}

```

```

// 31.7.5.4, unformatted input
streamsize gcount() const;
int_type get();
basic_istream& get(char_type& c);
basic_istream& get(char_type* s, streamsize n);
basic_istream& get(char_type* s, streamsize n, char_type delim);
basic_istream& get(basic_streambuf<char_type, traits>& sb);
basic_istream& get(basic_streambuf<char_type, traits>& sb, char_type delim);

basic_istream& getline(char_type* s, streamsize n);
basic_istream& getline(char_type* s, streamsize n, char_type delim);

basic_istream& ignore(streamsize n = 1, int_type delim = traits::eof());
int_type peek();
basic_istream& read (char_type* s, streamsize n);
streamsize readsome(char_type* s, streamsize n);

basic_istream& putback(char_type c);
basic_istream& unget();
int sync();

pos_type tellg();
basic_istream& seekg(pos_type);
basic_istream& seekg(off_type, ios_base::seekdir);

protected:
// 31.7.5.2.2, copy/move constructor
basic_istream(const basic_istream&) = delete;
basic_istream(basic_istream&& rhs);

// 31.7.5.2.3, assignment and swap
basic_istream& operator=(const basic_istream&) = delete;
basic_istream& operator=(basic_istream&& rhs);
void swap(basic_istream& rhs);
};

// 31.7.5.3.3, character extraction templates
template<class charT, class traits>
basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>&, charT&);
template<class traits>
basic_istream<char, traits>& operator>>(basic_istream<char, traits>&, unsigned char&);
template<class traits>
basic_istream<char, traits>& operator>>(basic_istream<char, traits>&, signed char&);

template<class charT, class traits, size_t N>
basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>&, charT(&)[N]);
template<class traits, size_t N>
basic_istream<char, traits>& operator>>(basic_istream<char, traits>&, unsigned char(&)[N]);
template<class traits, size_t N>
basic_istream<char, traits>& operator>>(basic_istream<char, traits>&, signed char(&)[N]);
}

```

The class template `basic_istream` defines a number of member function signatures that assist in reading and interpreting input from sequences controlled by a stream buffer.

Two groups of member function signatures share common properties: the *formatted input functions* (or *extractors*) and the *unformatted input functions*. Both groups of input functions are described as if they obtain (or *extract*) input *characters* by calling `rddbuf()->sbumpc()` or `rddbuf()->sgetc()`. They may use other public members of `istream`.

### 31.7.5.2.2 Constructors

[istream.cons]

```
explicit basic_istream(basic_streambuf<charT, traits>* sb);
```

*Effects:* Initializes the base class subobject with `basic_ios::init(sb)` (31.5.4.2).

*Postconditions:* `gcount() == 0`.

```
basic_istream(basic_istream&& rhs);
```

*Effects:* Default constructs the base class, copies the `gcount()` from `rhs`, calls `basic_ios<charT, traits>::move(rhs)` to initialize the base class, and sets the `gcount()` for `rhs` to 0.

```
virtual ~basic_istream();
```

*Remarks:* Does not perform any operations of `rdbuf()`.

### 31.7.5.2.3 Assignment and swap

[istream.assign]

```
basic_istream& operator=(basic_istream&& rhs);
```

*Effects:* Equivalent to: `swap(rhs)`.

*Returns:* `*this`.

```
void swap(basic_istream& rhs);
```

*Effects:* Calls `basic_ios<charT, traits>::swap(rhs)`. Exchanges the values returned by `gcount()` and `rhs.gcount()`.

### 31.7.5.2.4 Class `basic_istream::sentry`

[istream.sentry]

```
namespace std {
    template<class charT, class traits>
    class basic_istream<charT, traits>::sentry {
        bool ok_;
        // exposition only

    public:
        explicit sentry(basic_istream& is, bool noskipws = false);
        ~sentry();
        explicit operator bool() const { return ok_; };
        sentry(const sentry&) = delete;
        sentry& operator=(const sentry&) = delete;
    };
}
```

The class `sentry` defines a class that is responsible for doing exception safe prefix and suffix operations.

```
explicit sentry(basic_istream& is, bool noskipws = false);
```

*Effects:* If `is.good()` is false, calls `is.setstate(failbit)`. Otherwise, prepares for formatted or unformatted input. First, if `is.tie()` is not a null pointer, the function calls `is.tie()->flush()` to synchronize the output sequence with any associated external C stream. Except that this call can be suppressed if the put area of `is.tie()` is empty. Further an implementation is allowed to defer the call to `flush` until a call of `is.rdbuf()->underflow()` occurs. If no such call occurs before the `sentry` object is destroyed, the call to `flush` may be eliminated entirely.<sup>282</sup> If `noskipws` is zero and `is.flags() & ios_base::skipws` is nonzero, the function extracts and discards each character as long as the next available input character `c` is a whitespace character. If `is.rdbuf()->sgetc()` or `is.rdbuf()->sgetc()` returns `traits::eof()`, the function calls `setstate(failbit | eofbit)` (which may throw `ios_base::failure`).

*Remarks:* The constructor

```
explicit sentry(basic_istream& is, bool noskipws = false)
```

uses the currently imbued locale in `is`, to determine whether the next input character is whitespace or not.

To decide if the character `c` is a whitespace character, the constructor performs as if it executes the following code fragment:

```
const ctype<charT>& ctype = use_facet<ctype<charT>>(is.getloc());
if (ctype.is(ctype.space, c) != 0)
    // c is a whitespace character.
```

<sup>282</sup>) This will be possible only in functions that are part of the library. The semantics of the constructor used in user code is as specified.

If, after any preparation is completed, `is.good()` is `true`, `ok_ != false` otherwise, `ok_ == false`. During preparation, the constructor may call `setstate(failbit)` (which may throw `ios_base::failure` (31.5.4.4)).<sup>283</sup>

```
~sentry();
```

*Effects:* None.

```
explicit operator bool() const;
```

*Returns:* `ok_`.

### 31.7.5.3 Formatted input functions

[istream.formatted]

#### 31.7.5.3.1 Common requirements

[istream.formatted.reqmts]

Each formatted input function begins execution by constructing an object of type `ios_base::iostate`, termed the local error state, and initializing it to `ios_base::goodbit`. It then creates an object of class `sentry` with the `noskipws` (second) argument `false`. If the `sentry` object returns `true`, when converted to a value of type `bool`, the function endeavors to obtain the requested input. Otherwise, if the `sentry` constructor exits by throwing an exception or if the `sentry` object produces `false` when converted to a value of type `bool`, the function returns without attempting to obtain any input. If `rdbuf()->sbumpc()` or `rdbuf()->sgetc()` returns `traits::eof()`, then `ios_base::eofbit` is set in the local error state and the input function stops trying to obtain the requested input. If an exception is thrown during input then `ios_base::badbit` is set in the local error state, `*this`'s error state is set to the local error state, and the exception is rethrown if `(exceptions() & badbit) != 0`. After extraction is done, the input function calls `setstate`, which sets `*this`'s error state to the local error state, and may throw an exception. In any case, the formatted input function destroys the `sentry` object. If no exception has been thrown, it returns `*this`.

#### 31.7.5.3.2 Arithmetic extractors

[istream.formatted.arithmetic]

```
basic_istream& operator>>(unsigned short& val);
basic_istream& operator>>(unsigned int& val);
basic_istream& operator>>(long& val);
basic_istream& operator>>(unsigned long& val);
basic_istream& operator>>(long long& val);
basic_istream& operator>>(unsigned long long& val);
basic_istream& operator>>(float& val);
basic_istream& operator>>(double& val);
basic_istream& operator>>(long double& val);
basic_istream& operator>>(bool& val);
basic_istream& operator>>(void*& val);
```

As in the case of the inserters, these extractors depend on the locale's `num_get<>` (30.4.3.2) object to perform parsing the input stream data. These extractors behave as formatted input functions (as described in 31.7.5.3.1). After a `sentry` object is constructed, the conversion occurs as if performed by the following code fragment, where `state` represents the input function's local error state:

```
using numget = num_get<charT, istreambuf_iterator<charT, traits>>;
use_facet<numget>(loc).get(*this, 0, *this, state, val);
```

In the above fragment, `loc` stands for the private member of the `basic_ios` class.

NOTE 1 The first argument provides an object of the `istreambuf_iterator` class which is an iterator pointed to an input stream. It bypasses istreams and uses streambufs directly.

Class `locale` relies on this type as its interface to `istream`, so that it does not need to depend directly on `istream`.

```
basic_istream& operator>>(short& val);
```

The conversion occurs as if performed by the following code fragment (using the same notation as for the preceding code fragment):

```
using numget = num_get<charT, istreambuf_iterator<charT, traits>>;
long lval;
use_facet<numget>(loc).get(*this, 0, *this, state, lval);
```

<sup>283</sup>) The `sentry` constructor and destructor can also perform additional implementation-dependent operations.

```

    if (lval < numeric_limits<short>::min()) {
        state |= ios_base::failbit;
        val = numeric_limits<short>::min();
    } else if (numeric_limits<short>::max() < lval) {
        state |= ios_base::failbit;
        val = numeric_limits<short>::max();
    } else
        val = static_cast<short>(lval);

basic_istream& operator>>(int& val);

```

The conversion occurs as if performed by the following code fragment (using the same notation as for the preceding code fragment):

```

    using numget = num_get<charT, istreambuf_iterator<charT, traits>>;
    long lval;
    use_facet<numget>(loc).get(*this, 0, *this, state, lval);
    if (lval < numeric_limits<int>::min()) {
        state |= ios_base::failbit;
        val = numeric_limits<int>::min();
    } else if (numeric_limits<int>::max() < lval) {
        state |= ios_base::failbit;
        val = numeric_limits<int>::max();
    } else
        val = static_cast<int>(lval);

basic_istream& operator>>(extended-floating-point-type& val);

```

If the floating-point conversion rank of *extended-floating-point-type* is not less than or equal to that of `long double`, then an invocation of the operator function is conditionally supported with implementation-defined semantics.

Otherwise, let FP be a standard floating-point type:

- if the floating-point conversion rank of *extended-floating-point-type* is less than or equal to that of `float`, then FP is `float`,
- otherwise, if the floating-point conversion rank of *extended-floating-point-type* is less than or equal to that of `double`, then FP is `double`,
- otherwise, FP is `long double`.

The conversion occurs as if performed by the following code fragment (using the same notation as for the preceding code fragment):

```

    using numget = num_get<charT, istreambuf_iterator<charT, traits>>;
    FP fval;
    use_facet<numget>(loc).get(*this, 0, *this, state, fval);
    if (fval < -numeric_limits<extended-floating-point-type>::max()) {
        state |= ios_base::failbit;
        val = -numeric_limits<extended-floating-point-type>::max();
    } else if (numeric_limits<extended-floating-point-type>::max() < fval) {
        state |= ios_base::failbit;
        val = numeric_limits<extended-floating-point-type>::max();
    } else {
        val = static_cast<extended-floating-point-type>(fval);
    }

```

NOTE 2 When the extended floating-point type has a floating-point conversion rank that is not equal to the rank of any standard floating-point type, then double rounding during the conversion can result in inaccurate results. `from_chars` can be used in situations where maximum accuracy is important.

### 31.7.5.3.3 `basic_istream::operator>>` [istream.extractors]

```
basic_istream& operator>>(basic_istream& (*pf)(basic_istream&));
```

*Effects:* None. This extractor does not behave as a formatted input function (as described in 31.7.5.3.1).

*Returns:* `pf(*this)`.<sup>284</sup>

<sup>284</sup> See, for example, the function signature `ws(basic_istream&)` (31.7.5.5).

```
basic_istream& operator>>(basic_ios<charT, traits>& (*pf)(basic_ios<charT, traits>&));
```

*Effects:* Calls `pf(*this)`. This extractor does not behave as a formatted input function (as described in 31.7.5.3.1).

*Returns:* `*this`.

```
basic_istream& operator>>(ios_base& (*pf)(ios_base&));
```

*Effects:* Calls `pf(*this)`.<sup>285</sup> This extractor does not behave as a formatted input function (as described in 31.7.5.3.1).

*Returns:* `*this`.

```
template<class charT, class traits, size_t N>
    basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>& in, charT (&s)[N]);
template<class traits, size_t N>
    basic_istream<char, traits>& operator>>(basic_istream<char, traits>& in, unsigned char (&s)[N]);
template<class traits, size_t N>
    basic_istream<char, traits>& operator>>(basic_istream<char, traits>& in, signed char (&s)[N]);
```

*Effects:* Behaves like a formatted input member (as described in 31.7.5.3.1) of `in`. After a `sentry` object is constructed, `operator>>` extracts characters and stores them into `s`. If `width()` is greater than zero, `n` is `min(size_t(width()), N)`. Otherwise `n` is `N`. `n` is the maximum number of characters stored.

Characters are extracted and stored until any of the following occurs:

- `n-1` characters are stored;
- end of file occurs on the input sequence;
- letting `ct` be `use_facet<ctype<charT>>(in.getloc())`, `ct.is(ct.space, c)` is true.

`operator>>` then stores a null byte (`charT()`) in the next position, which may be the first position if no characters were extracted. `operator>>` then calls `width(0)`.

If the function extracted no characters, `ios_base::failbit` is set in the input function's local error state before `setstate` is called.

*Returns:* `in`.

```
template<class charT, class traits>
    basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>& in, charT& c);
template<class traits>
    basic_istream<char, traits>& operator>>(basic_istream<char, traits>& in, unsigned char& c);
template<class traits>
    basic_istream<char, traits>& operator>>(basic_istream<char, traits>& in, signed char& c);
```

*Effects:* Behaves like a formatted input member (as described in 31.7.5.3.1) of `in`. A character is extracted from `in`, if one is available, and stored in `c`. Otherwise, `ios_base::failbit` is set in the input function's local error state before `setstate` is called.

*Returns:* `in`.

```
basic_istream& operator>>(basic_streambuf<charT, traits>* sb);
```

*Effects:* Behaves as an unformatted input function (31.7.5.4). If `sb` is null, calls `setstate(fail-bit)`, which may throw `ios_base::failure` (31.5.4.4). After a `sentry` object is constructed, extracts characters from `*this` and inserts them in the output sequence controlled by `sb`. Characters are extracted and inserted until any of the following occurs:

- end-of-file occurs on the input sequence;
- inserting in the output sequence fails (in which case the character to be inserted is not extracted);
- an exception occurs (in which case the exception is caught).

If the function inserts no characters, `ios_base::failbit` is set in the input function's local error state before `setstate` is called.

*Returns:* `*this`.

<sup>285</sup> See, for example, the function signature `dec(ios_base&)` (31.5.5.3).

## 31.7.5.4 Unformatted input functions

[istream.unformatted]

Each unformatted input function begins execution by constructing an object of type `ios_base::iostate`, termed the local error state, and initializing it to `ios_base::goodbit`. It then creates an object of class `sentry` with the default argument `noskipws` (second) argument `true`. If the `sentry` object returns `true`, when converted to a value of type `bool`, the function endeavors to obtain the requested input. Otherwise, if the `sentry` constructor exits by throwing an exception or if the `sentry` object produces `false`, when converted to a value of type `bool`, the function returns without attempting to obtain any input. In either case the number of extracted characters is set to 0; unformatted input functions taking a character array of nonzero size as an argument shall also store a null character (using `charT()`) in the first location of the array. If `rdbuf()->sgetc()` or `rdbuf()->sgetpc()` returns `traits::eof()`, then `ios_base::eofbit` is set in the local error state and the input function stops trying to obtain the requested input. If an exception is thrown during input then `ios_base::badbit` is set in the local error state, `*this`'s error state is set to the local error state, and the exception is rethrown if `(exceptions() & badbit) != 0`. If no exception has been thrown it stores the number of characters extracted in a member object. After extraction is done, the input function calls `setstate`, which sets `*this`'s error state to the local error state, and may throw an exception. In any event the `sentry` object is destroyed before leaving the unformatted input function.

```
streamsize gcount() const;
```

*Effects:* None. This member function does not behave as an unformatted input function (as described above).

*Returns:* The number of characters extracted by the last unformatted input member function called for the object. If the number cannot be represented, returns `numeric_limits<streamsize>::max()`.

```
int_type get();
```

*Effects:* Behaves as an unformatted input function (as described above). After constructing a `sentry` object, extracts a character `c`, if one is available. Otherwise, `ios_base::failbit` is set in the input function's local error state before `setstate` is called.

*Returns:* `c` if available, otherwise `traits::eof()`.

```
basic_istream& get(char_type& c);
```

*Effects:* Behaves as an unformatted input function (as described above). After constructing a `sentry` object, extracts a character, if one is available, and assigns it to `c`.<sup>286</sup> Otherwise, `ios_base::failbit` is set in the input function's local error state before `setstate` is called.

*Returns:* `*this`.

```
basic_istream& get(char_type* s, streamsize n, char_type delim);
```

*Effects:* Behaves as an unformatted input function (as described above). After constructing a `sentry` object, extracts characters and stores them into successive locations of an array whose first element is designated by `s`.<sup>287</sup> Characters are extracted and stored until any of the following occurs:

- `n` is less than one or `n - 1` characters are stored;
- end-of-file occurs on the input sequence;
- `traits::eq(c, delim)` for the next available input character `c` (in which case `c` is not extracted).

If the function stores no characters, `ios_base::failbit` is set in the input function's local error state before `setstate` is called. In any case, if `n` is greater than zero it then stores a null character into the next successive location of the array.

*Returns:* `*this`.

```
basic_istream& get(char_type* s, streamsize n);
```

*Effects:* Calls `get(s, n, widen('\n'))`.

*Returns:* Value returned by the call.

<sup>286</sup>) Note that this function is not overloaded on types `signed char` and `unsigned char`.

<sup>287</sup>) Note that this function is not overloaded on types `signed char` and `unsigned char`.

```
basic_istream& get(basic_streambuf<char_type, traits>& sb, char_type delim);
```

*Effects:* Behaves as an unformatted input function (as described above). After constructing a **sentry** object, extracts characters and inserts them in the output sequence controlled by **sb**. Characters are extracted and inserted until any of the following occurs:

- end-of-file occurs on the input sequence;
- inserting in the output sequence fails (in which case the character to be inserted is not extracted);
- **traits::eq(c, delim)** for the next available input character **c** (in which case **c** is not extracted);
- an exception occurs (in which case, the exception is caught but not rethrown).

If the function inserts no characters, **ios\_base::failbit** is set in the input function's local error state before **setstate** is called.

*Returns:* **\*this**.

```
basic_istream& get(basic_streambuf<char_type, traits>& sb);
```

*Effects:* Calls **get(sb, widen('\n'))**.

*Returns:* Value returned by the call.

```
basic_istream& getline(char_type* s, streamsize n, char_type delim);
```

*Effects:* Behaves as an unformatted input function (as described above). After constructing a **sentry** object, extracts characters and stores them into successive locations of an array whose first element is designated by **s**.<sup>288</sup> Characters are extracted and stored until one of the following occurs:

1. end-of-file occurs on the input sequence;
2. **traits::eq(c, delim)** for the next available input character **c** (in which case the input character is extracted but not stored);<sup>289</sup>
3. **n** is less than one or **n - 1** characters are stored (in which case the function calls **setstate(failbit)**).

These conditions are tested in the order shown.<sup>290</sup>

If the function extracts no characters, **ios\_base::failbit** is set in the input function's local error state before **setstate** is called.<sup>291</sup>

In any case, if **n** is greater than zero, it then stores a null character (using **charT()**) into the next successive location of the array.

*Returns:* **\*this**.

EXAMPLE

```
#include <iostream>

int main() {
    using namespace std;
    const int line_buffer_size = 100;

    char buffer[line_buffer_size];
    int line_number = 0;
    while (cin.getline(buffer, line_buffer_size, '\n') || cin.gcount()) {
        int count = cin.gcount();
        if (cin.eof())
            cout << "Partial final line";    // cin.fail() is false
        else if (cin.fail()) {
            cout << "Partial long line";
            cin.clear(cin.rdstate() & ~ios_base::failbit);
        } else {
            count--;
            // Don't include newline in count
        }
        line_number++;
    }
}
```

<sup>288</sup>) Note that this function is not overloaded on types **signed char** and **unsigned char**.

<sup>289</sup>) Since the final input character is “extracted”, it is counted in the **gcount()**, even though it is not stored.

<sup>290</sup>) This allows an input line which exactly fills the buffer, without setting **failbit**. This is different behavior than the historical AT&T implementation.

<sup>291</sup>) This implies an empty input line will not cause **failbit** to be set.

```

        cout << "Line " << ++line_number;
    }
    cout << " (" << count << " chars): " << buffer << endl;
}
}

```

`basic_istream& getline(char_type* s, streamsize n);`

*Returns:* `getline(s, n, widen('\n'))`

`basic_istream& ignore(streamsize n = 1, int_type delim = traits::eof());`

*Effects:* Behaves as an unformatted input function (as described above). After constructing a `sentry` object, extracts characters and discards them. Characters are extracted until any of the following occurs:

- `n != numeric_limits<streamsize>::max()` (17.3.5) and `n` characters have been extracted so far
- end-of-file occurs on the input sequence (in which case the function calls `setstate(eofbit)`, which may throw `ios_base::failure` (31.5.4.4));
- `traits::eq_int_type(traits::to_int_type(c), delim)` for the next available input character `c` (in which case `c` is extracted).

NOTE 1 The last condition will never occur if `traits::eq_int_type(delim, traits::eof())`.

*Returns:* `*this`.

`int_type peek();`

*Effects:* Behaves as an unformatted input function (as described above). After constructing a `sentry` object, reads but does not extract the current input character.

*Returns:* `traits::eof()` if `good()` is false. Otherwise, returns `rdbuf()->sgetc()`.

`basic_istream& read(char_type* s, streamsize n);`

*Effects:* Behaves as an unformatted input function (as described above). After constructing a `sentry` object, if `!good()` calls `setstate(failbit)` which may throw an exception, and return. Otherwise extracts characters and stores them into successive locations of an array whose first element is designated by `s`.<sup>292</sup> Characters are extracted and stored until either of the following occurs:

- `n` characters are stored;
- end-of-file occurs on the input sequence (in which case the function calls `setstate(failbit | eofbit)`, which may throw `ios_base::failure` (31.5.4.4)).

*Returns:* `*this`.

`streamsize readsome(char_type* s, streamsize n);`

*Effects:* Behaves as an unformatted input function (as described above). After constructing a `sentry` object, if `!good()` calls `setstate(failbit)` which may throw an exception, and return. Otherwise extracts characters and stores them into successive locations of an array whose first element is designated by `s`. If `rdbuf()->in_avail() == -1`, calls `setstate(eofbit)` (which may throw `ios_base::failure` (31.5.4.4)), and extracts no characters;

- If `rdbuf()->in_avail() == 0`, extracts no characters
- If `rdbuf()->in_avail() > 0`, extracts `min(rdbuf()->in_avail(), n)`.

*Returns:* The number of characters extracted.

`basic_istream& putback(char_type c);`

*Effects:* Behaves as an unformatted input function (as described above), except that the function first clears `eofbit`. After constructing a `sentry` object, if `!good()` calls `setstate(failbit)` which may throw an exception, and return. If `rdbuf()` is not null, calls `rdbuf()->sputbackc(c)`. If `rdbuf()` is null, or if `sputbackc` returns `traits::eof()`, calls `setstate(badbit)` (which may throw `ios_base::failure` (31.5.4.4)).

<sup>292</sup>) Note that this function is not overloaded on types `signed char` and `unsigned char`.

NOTE 2 This function extracts no characters, so the value returned by the next call to `gcount()` is 0.

*Returns: \*this.*

`basic_istream& unget();`

*Effects:* Behaves as an unformatted input function (as described above), except that the function first clears `eofbit`. After constructing a `sentry` object, if `!good()` calls `setstate(failbit)` which may throw an exception, and return. If `rddbuf()` is not null, calls `rddbuf()->sungetc()`. If `rddbuf()` is null, or if `sungetc` returns `traits::eof()`, calls `setstate(badbit)` (which may throw `ios_base::failure` (31.5.4.4)).

NOTE 3 This function extracts no characters, so the value returned by the next call to `gcount()` is 0.

*Returns: \*this.*

`int sync();`

*Effects:* Behaves as an unformatted input function (as described above), except that it does not count the number of characters extracted and does not affect the value returned by subsequent calls to `gcount()`. After constructing a `sentry` object, if `rddbuf()` is a null pointer, returns -1. Otherwise, calls `rddbuf()->pubsync()` and, if that function returns -1 calls `setstate(badbit)` (which may throw `ios_base::failure` (31.5.4.4), and returns -1. Otherwise, returns zero.

`pos_type tellg();`

*Effects:* Behaves as an unformatted input function (as described above), except that it does not count the number of characters extracted and does not affect the value returned by subsequent calls to `gcount()`.

*Returns:* After constructing a `sentry` object, if `fail() != false`, returns `pos_type(-1)` to indicate failure. Otherwise, returns `rddbuf()->pubseekoff(0, cur, in)`.

`basic_istream& seekg(pos_type pos);`

*Effects:* Behaves as an unformatted input function (as described above), except that the function first clears `eofbit`, it does not count the number of characters extracted, and it does not affect the value returned by subsequent calls to `gcount()`. After constructing a `sentry` object, if `fail() != true`, executes `rddbuf()->pubseekpos(pos, ios_base::in)`. In case of failure, the function calls `setstate(failbit)` (which may throw `ios_base::failure`).

*Returns: \*this.*

`basic_istream& seekg(off_type off, ios_base::seekdir dir);`

*Effects:* Behaves as an unformatted input function (as described above), except that the function first clears `eofbit`, does not count the number of characters extracted, and does not affect the value returned by subsequent calls to `gcount()`. After constructing a `sentry` object, if `fail() != true`, executes `rddbuf()->pubseekoff(off, dir, ios_base::in)`. In case of failure, the function calls `setstate(failbit)` (which may throw `ios_base::failure`).

*Returns: \*this.*

### 31.7.5.5 Standard `basic_istream` manipulators

[istream.manip]

Each instantiation of the function template specified in this subclause is a designated addressable function (16.4.5.2.1).

`template<class charT, class traits>`

`basic_istream<charT, traits>& ws(basic_istream<charT, traits>& is);`

*Effects:* Behaves as an unformatted input function (31.7.5.4), except that it does not count the number of characters extracted and does not affect the value returned by subsequent calls to `is.gcount()`. After constructing a `sentry` object extracts characters as long as the next available character `c` is whitespace or until there are no more characters in the sequence. Whitespace characters are distinguished with the same criterion as used by `sentry::sentry` (31.7.5.2.4). If `ws` stops extracting characters because there are no more available it sets `eofbit`, but not `failbit`.

*Returns: is.*

## 31.7.5.6 Rvalue stream extraction

[istream.rvalue]

```
template<class Istream, class T>
Istream&& operator>>(Istream&& is, T&& x);
```

*Constraints:* The expression `is >> std::forward<T>(x)` is well-formed when treated as an unevaluated operand (7.2.3) and `Istream` is publicly and unambiguously derived from `ios_base`.

*Effects:* Equivalent to:

```
is >> std::forward<T>(x);
return std::move(is);
```

31.7.5.7 Class template `basic_istream`

[iostreamclass]

## 31.7.5.7.1 General

[iostreamclass.general]

```
namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_istream
    : public basic_istream<charT, traits>,
      public basic_ostream<charT, traits> {
    public:
        using char_type    = charT;
        using int_type      = typename traits::int_type;
        using pos_type      = typename traits::pos_type;
        using off_type      = typename traits::off_type;
        using traits_type   = traits;

        // 31.7.5.7.2, constructor
        explicit basic_istream(basic_streambuf<charT, traits>* sb);

        // 31.7.5.7.3, destructor
        virtual ~basic_istream();

    protected:
        // 31.7.5.7.2, constructor
        basic_istream(const basic_istream&) = delete;
        basic_istream(basic_istream&& rhs);

        // 31.7.5.7.4, assignment and swap
        basic_istream& operator=(const basic_istream&) = delete;
        basic_istream& operator=(basic_istream&& rhs);
        void swap(basic_istream& rhs);
    };
}
```

The class template `basic_istream` inherits a number of functions that allow reading input and writing output to sequences controlled by a stream buffer.

## 31.7.5.7.2 Constructors

[iostream.cons]

```
explicit basic_istream(basic_streambuf<charT, traits>* sb);
```

*Effects:* Initializes the base class subobjects with `basic_istream<charT, traits>(sb)` (31.7.5.2) and `basic_ostream<charT, traits>(sb)` (31.7.6.2).

*Postconditions:* `rddbuf() == sb` and `gcount() == 0`.

```
basic_istream(basic_istream&& rhs);
```

*Effects:* Move constructs from the rvalue `rhs` by constructing the `basic_istream` base class with `std::move(rhs)`.

## 31.7.5.7.3 Destructor

[iostream.dest]

```
virtual ~basic_istream();
```

*Remarks:* Does not perform any operations on `rddbuf()`.

**31.7.5.7.4 Assignment and swap****[iostream.assign]**

```
basic_ostream& operator=(basic_ostream&& rhs);
```

*Effects:* Equivalent to: `swap(rhs)`.

```
void swap(basic_ostream& rhs);
```

*Effects:* Calls `basic_istream<charT, traits>::swap(rhs)`.

**31.7.6 Output streams****[output.streams]****31.7.6.1 General****[output.streams.general]**

The header `<ostream>` defines a class template and several function templates that control output to a stream buffer, along with a function template that inserts into stream rvalues.

**31.7.6.2 Class template `basic_ostream`****[ostream]****31.7.6.2.1 General****[ostream.general]**

When a function has a parameter type *extended-floating-point-type*, the implementation provides overloads for all cv-unqualified extended floating-point types (6.8.2).

```
namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_ostream : virtual public basic_ios<charT, traits> {
    public:
        // types (inherited from basic_ios (31.5.4))
        using char_type    = charT;
        using int_type      = typename traits::int_type;
        using pos_type      = typename traits::pos_type;
        using off_type      = typename traits::off_type;
        using traits_type    = traits;

        // 31.7.6.2.2, constructor/destructor
        explicit basic_ostream(basic_streambuf<char_type, traits>* sb);
        virtual ~basic_ostream();

        // 31.7.6.2.4, prefix/suffix
        class sentry;

        // 31.7.6.3, formatted output
        basic_ostream& operator<<(basic_ostream& (*pf)(basic_ostream&));
        basic_ostream& operator<<(basic_ios<charT, traits>& (*pf)(basic_ios<charT, traits>&));
        basic_ostream& operator<<(ios_base& (*pf)(ios_base&));

        basic_ostream& operator<<(bool n);
        basic_ostream& operator<<(short n);
        basic_ostream& operator<<(unsigned short n);
        basic_ostream& operator<<(int n);
        basic_ostream& operator<<(unsigned int n);
        basic_ostream& operator<<(long n);
        basic_ostream& operator<<(unsigned long n);
        basic_ostream& operator<<(long long n);
        basic_ostream& operator<<(unsigned long long n);
        basic_ostream& operator<<(float f);
        basic_ostream& operator<<(double f);
        basic_ostream& operator<<(long double f);
        basic_ostream& operator<<(extended-floating-point-type f);

        basic_ostream& operator<<(const void* p);
        basic_ostream& operator<<(const volatile void* p);
        basic_ostream& operator<<(nullptr_t);
        basic_ostream& operator<<(basic_streambuf<char_type, traits>* sb);

        // 31.7.6.4, unformatted output
        basic_ostream& put(char_type c);
        basic_ostream& write(const char_type* s, streamsize n);
    };
}
```

```

basic_ostream& flush();

// 31.7.6.2.5, seeks
pos_type tellp();
basic_ostream& seekp(pos_type);
basic_ostream& seekp(off_type, ios_base::seekdir);

protected:
// 31.7.6.2.2, copy/move constructor
basic_ostream(const basic_ostream&) = delete;
basic_ostream(basic_ostream&& rhs);

// 31.7.6.2.3, assignment and swap
basic_ostream& operator=(const basic_ostream&) = delete;
basic_ostream& operator=(basic_ostream&& rhs);
void swap(basic_ostream& rhs);
};

// 31.7.6.3.4, character inserters

    basic_ostream<wchar_t, traits>&
        operator<<(basic_ostream<wchar_t, traits>&, const char32_t*) = delete;
}

```

The class template `basic_ostream` defines a number of member function signatures that assist in formatting and writing output to output sequences controlled by a stream buffer.

Two groups of member function signatures share common properties: the *formatted output functions* (or *inserters*) and the *unformatted output functions*. Both groups of output functions generate (or *insert*) output *characters* by actions equivalent to calling `rddbuf() -> sputc(int_type)`. They may use other public members of `basic_ostream` except that they shall not invoke any virtual members of `rddbuf()` except `overflow()`, `xspn()`, and `sync()`.

If one of these called functions throws an exception, then unless explicitly noted otherwise the output function sets `badbit` in the error state. If `badbit` is set in `exceptions()`, the output function rethrows the exception without completing its actions, otherwise it does not throw anything and proceeds as if the called function had returned a failure indication.

NOTE The deleted overloads of `operator<<` prevent formatting characters as integers and strings as pointers.

#### 31.7.6.2.2 Constructors [ostream.cons]

```
explicit basic_ostream(basic_streambuf<charT, traits>* sb);
```

*Effects:* Initializes the base class subobject with `basic_ios<charT, traits>::init(sb)` (31.5.4.2).

*Postconditions:* `rddbuf() == sb`.

```
basic_ostream(basic_ostream&& rhs);
```

*Effects:* Move constructs from the rvalue `rhs`. This is accomplished by default constructing the base class and calling `basic_ios<charT, traits>::move(rhs)` to initialize the base class.

```
virtual ~basic_ostream();
```

*Remarks:* Does not perform any operations on `rddbuf()`.

#### 31.7.6.2.3 Assignment and swap [ostream.assign]

```
basic_ostream& operator=(basic_ostream&& rhs);
```

*Effects:* Equivalent to: `swap(rhs)`.

*Returns:* `*this`.

```
void swap(basic_ostream& rhs);
```

*Effects:* Calls `basic_ios<charT, traits>::swap(rhs)`.

#### 31.7.6.2.4 Class `basic_ostream::sentry` [ostream.sentry]

```

namespace std {
    template<class charT, class traits>
    class basic_ostream<charT, traits>::sentry {
        bool ok_;           // exposition only
    };
}

```

```

public:
    explicit sentry(basic_ostream& os);
    ~sentry();
    explicit operator bool() const { return ok_; }

    sentry(const sentry&) = delete;
    sentry& operator=(const sentry&) = delete;
};
}

```

The class `sentry` defines a class that is responsible for doing exception safe prefix and suffix operations.

```
explicit sentry(basic_ostream& os);
```

If `os.good()` is nonzero, prepares for formatted or unformatted output. If `os.tie()` is not a null pointer, calls `os.tie()->flush()`.<sup>293</sup>

If, after any preparation is completed, `os.good()` is true, `ok_ == true` otherwise, `ok_ == false`. During preparation, the constructor may call `setstate(failbit)` (which may throw `ios_base::failure` (31.5.4.4)).<sup>294</sup>

```
~sentry();
```

If `(os.flags() & ios_base::unitbuf) && !uncaught_exceptions() && os.good()` is true, calls `os.rdbuf()->pubsync()`. If that function returns `-1`, sets `badbit` in `os.rdstate()` without propagating an exception.

```
explicit operator bool() const;
```

*Effects:* Returns `ok_`.

#### 31.7.6.2.5 Seek members

[ostream.seek]

Each seek member function begins execution by constructing an object of class `sentry`. It returns by destroying the `sentry` object.

```
pos_type tellp();
```

*Returns:* If `fail() != false`, returns `pos_type(-1)` to indicate failure. Otherwise, returns `rdbuf()->pubseekoff(0, cur, out)`.

```
basic_ostream& seekp(pos_type pos);
```

*Effects:* If `fail() != true`, executes `rdbuf()->pubseekpos(pos, ios_base::out)`. In case of failure, the function calls `setstate(failbit)` (which may throw `ios_base::failure`).

*Returns:* `*this`.

```
basic_ostream& seekp(off_type off, ios_base::seekdir dir);
```

*Effects:* If `fail() != true`, executes `rdbuf()->pubseekoff(off, dir, ios_base::out)`. In case of failure, the function calls `setstate(failbit)` (which may throw `ios_base::failure`).

*Returns:* `*this`.

#### 31.7.6.3 Formatted output functions

[ostream.formatted]

##### 31.7.6.3.1 Common requirements

[ostream.formatted.reqmts]

Each formatted output function begins execution by constructing an object of class `sentry`. If that object returns `true` when converted to a value of type `bool`, the function endeavors to generate the requested output. If the generation fails, then the formatted output function does `setstate(ios_base::failbit)`, which can throw an exception. If an exception is thrown during output, then `ios_base::badbit` is set<sup>295</sup> in `*this`'s error state. If `(exceptions() & badbit) != 0` then the exception is rethrown. Whether or not an exception is thrown, the `sentry` object is destroyed before leaving the formatted output function. If no exception is thrown, the result of the formatted output function is `*this`.

<sup>293</sup>) The call `os.tie()->flush()` does not necessarily occur if the function can determine that no synchronization is necessary.

<sup>294</sup>) The `sentry` constructor and destructor can also perform additional implementation-dependent operations.

<sup>295</sup>) This is done without causing an `ios_base::failure` to be thrown.

The descriptions of the individual formatted output functions describe how they perform output and do not mention the `sentry` object.

If a formatted output function of a stream `os` determines padding, it does so as follows. Given a `charT` character sequence `seq` where `charT` is the character type of the stream, if the length of `seq` is less than `os.width()`, then enough copies of `os.fill()` are added to this sequence as necessary to pad to a width of `os.width()` characters. If `(os.flags() & ios_base::adjustfield) == ios_base::left` is `true`, the fill characters are placed after the character sequence; otherwise, they are placed before the character sequence.

### 31.7.6.3.2 Arithmetic inserters

[ostream.inserters.arithmetic]

```
basic_ostream& operator<<(bool val);
basic_ostream& operator<<(short val);
basic_ostream& operator<<(unsigned short val);
basic_ostream& operator<<(int val);
basic_ostream& operator<<(unsigned int val);
basic_ostream& operator<<(long val);
basic_ostream& operator<<(unsigned long val);
basic_ostream& operator<<(long long val);
basic_ostream& operator<<(unsigned long long val);
basic_ostream& operator<<(float val);
basic_ostream& operator<<(double val);
basic_ostream& operator<<(long double val);
basic_ostream& operator<<(const void* val);
```

*Effects:* The classes `num_get<>` and `num_put<>` handle locale-dependent numeric formatting and parsing. These inserter functions use the imbued `locale` value to perform numeric formatting. When `val` is of type `bool`, `long`, `unsigned long`, `long long`, `unsigned long long`, `double`, `long double`, or `const void*`, the formatting conversion occurs as if it performed the following code fragment:

```
bool failed = use_facet<
    num_put<charT, ostreambuf_iterator<charT, traits>>
    >(getloc()).put(*this, *this, fill(), val).failed();
```

When `val` is of type `short` the formatting conversion occurs as if it performed the following code fragment:

```
ios_base::fmtflags baseflags = ios_base::flags() & ios_base::basefield;
bool failed = use_facet<
    num_put<charT, ostreambuf_iterator<charT, traits>>
    >(getloc()).put(*this, *this, fill(),
        baseflags == ios_base::oct || baseflags == ios_base::hex
        ? static_cast<long>(static_cast<unsigned short>(val))
        : static_cast<long>(val)).failed();
```

When `val` is of type `int` the formatting conversion occurs as if it performed the following code fragment:

```
ios_base::fmtflags baseflags = ios_base::flags() & ios_base::basefield;
bool failed = use_facet<
    num_put<charT, ostreambuf_iterator<charT, traits>>
    >(getloc()).put(*this, *this, fill(),
        baseflags == ios_base::oct || baseflags == ios_base::hex
        ? static_cast<long>(static_cast<unsigned int>(val))
        : static_cast<long>(val)).failed();
```

When `val` is of type `unsigned short` or `unsigned int` the formatting conversion occurs as if it performed the following code fragment:

```
bool failed = use_facet<
    num_put<charT, ostreambuf_iterator<charT, traits>>
    >(getloc()).put(*this, *this, fill(),
        static_cast<unsigned long>(val)).failed();
```

When `val` is of type `float` the formatting conversion occurs as if it performed the following code fragment:

```
bool failed = use_facet<
    num_put<charT, ostreambuf_iterator<charT, traits>>
    >(getloc()).put(*this, *this, fill(),
        static_cast<double>(val)).failed();
```

The first argument provides an object of the `ostreambuf_iterator<>` class which is an iterator for class `basic_ostream<>`. It bypasses `ostreams` and uses `streambufs` directly. Class `locale` relies on these types as its interface to `iostreams`, since for flexibility it has been abstracted away from direct dependence on `ostream`. The second parameter is a reference to the base class subobject of type `ios_base`. It provides formatting specifications such as field width, and a locale from which to obtain other facets. If `failed` is `true` then does `setstate(badbit)`, which may throw an exception, and returns.

*Returns:* `*this`.

```
basic_ostream& operator<<(const volatile void* p);
```

*Effects:* Equivalent to: `return operator<<(const_cast<const void*>(p));`

```
basic_ostream& operator<<(extended-floating-point-type val);
```

*Effects:* If the floating-point conversion rank of `extended-floating-point-type` is less than or equal to that of `double`, the formatting conversion occurs as if it performed the following code fragment:

```
bool failed = use_facet<
    num_put<charT, ostreambuf_iterator<charT, traits>>
    >(getloc()).put(*this, *this, fill(),
        static_cast<double>(val)).failed();
```

Otherwise, if the floating-point conversion rank of `extended-floating-point-type` is less than or equal to that of `long double`, the formatting conversion occurs as if it performed the following code fragment:

```
bool failed = use_facet<
    num_put<charT, ostreambuf_iterator<charT, traits>>
    >(getloc()).put(*this, *this, fill(),
        static_cast<long double>(val)).failed();
```

Otherwise, an invocation of the operator function is conditionally supported with implementation-defined semantics.

If `failed` is `true` then does `setstate(badbit)`, which may throw an exception, and returns.

*Returns:* `*this`.

### 31.7.6.3.3 `basic_ostream::operator<<` [ostream.inserters]

```
basic_ostream& operator<<(basic_ostream& (*pf)(basic_ostream&));
```

*Effects:* None. Does not behave as a formatted output function (as described in 31.7.6.3.1).

*Returns:* `pf(*this)`.<sup>296</sup>

```
basic_ostream& operator<<(basic_ios<charT, traits>& (*pf)(basic_ios<charT, traits>&));
```

*Effects:* Calls `pf(*this)`. This inserter does not behave as a formatted output function (as described in 31.7.6.3.1).

*Returns:* `*this`.<sup>297</sup>

```
basic_ostream& operator<<(ios_base& (*pf)(ios_base&));
```

*Effects:* Calls `pf(*this)`. This inserter does not behave as a formatted output function (as described in 31.7.6.3.1).

*Returns:* `*this`.

```
basic_ostream& operator<<(basic_streambuf<charT, traits>* sb);
```

*Effects:* Behaves as an unformatted output function (31.7.6.4). After the `sentry` object is constructed, if `sb` is null calls `setstate(badbit)` (which may throw `ios_base::failure`).

<sup>296</sup> See, for example, the function signature `endl(basic_ostream&)` (31.7.6.5).

<sup>297</sup> See, for example, the function signature `dec(ios_base&)` (31.5.5.3).

Gets characters from **sb** and inserts them in **\*this**. Characters are read from **sb** and inserted until any of the following occurs:

- end-of-file occurs on the input sequence;
- inserting in the output sequence fails (in which case the character to be inserted is not extracted);
- an exception occurs while getting a character from **sb**.

If the function inserts no characters, it calls `setstate(failbit)` (which may throw `ios_base::failure` (31.5.4.4)). If an exception was thrown while extracting a character, the function sets `failbit` in the error state, and if `failbit` is set in `exceptions()` the caught exception is rethrown.

*Returns:* **\*this**.

```
basic_ostream& operator<<(nullptr_t);
```

*Effects:* Equivalent to:

```
return *this << s;
```

where **s** is an implementation-defined NTCTS (3.34).

### 31.7.6.3.4 Character inserter function templates

[ostream.insetters.character]

```
template<class charT, class traits>
    basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& out, charT c);
template<class charT, class traits>
    basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& out, char c);
// specialization
template<class traits>
    basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>& out, char c);
// signed and unsigned
template<class traits>
    basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>& out, signed char c);
template<class traits>
    basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>& out, unsigned char c);
```

*Effects:* Behaves as a formatted output function (31.7.6.3.1) of **out**. Constructs a character sequence **seq**. If **c** has type **char** and the character type of the stream is not **char**, then **seq** consists of **out.widen(c)**; otherwise **seq** consists of **c**. Determines padding for **seq** as described in 31.7.6.3.1. Inserts **seq** into **out**. Calls **os.width(0)**.

*Returns:* **out**.

```
template<class charT, class traits>
    basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& out, const charT* s);
template<class charT, class traits>
    basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& out, const char* s);
template<class traits>
    basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>& out, const char* s);
template<class traits>
    basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>& out, const signed char* s);
template<class traits>
    basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>& out,
                                         const unsigned char* s);
```

*Preconditions:* **s** is not a null pointer.

*Effects:* Behaves like a formatted inserter (as described in 31.7.6.3.1) of **out**. Creates a character sequence **seq** of **n** characters starting at **s**, each widened using **out.widen()** (31.5.4.3), where **n** is the number that would be computed as if by:

- `traits::length(s)` for the overload where the first argument is of type `basic_ostream<charT, traits>&` and the second is of type `const charT*`, and also for the overload where the first argument is of type `basic_ostream<char, traits>&` and the second is of type `const char*`,
- `char_traits<char>::length(s)` for the overload where the first argument is of type `basic_ostream<charT, traits>&` and the second is of type `const char*`,
- `traits::length(reinterpret_cast<const char*>(s))` for the other two overloads.

Determines padding for `seq` as described in 31.7.6.3.1. Inserts `seq` into `out`. Calls `width(0)`.

*Returns:* `out`.

### 31.7.6.3.5 Print

[ostream.formatted.print]

```
template<class... Args>
void print(ostream& os, format_string<Args...> fmt, Args&&... args);
```

*Effects:* If the ordinary literal encoding (5.3) is UTF-8, equivalent to:

```
vprint_unicode(os, fmt.str, make_format_args(std::forward<Args>(args)...));
```

Otherwise, equivalent to:

```
vprint_nonunicode(os, fmt.str, make_format_args(std::forward<Args>(args)...));
```

```
template<class... Args>
void println(ostream& os, format_string<Args...> fmt, Args&&... args);
```

*Effects:* Equivalent to:

```
print(os, "{}\n", format(fmt, std::forward<Args>(args)...));
```

```
void vprint_unicode(ostream& os, string_view fmt, format_args args);
void vprint_nonunicode(ostream& os, string_view fmt, format_args args);
```

*Effects:* Behaves as a formatted output function (31.7.6.3.1) of `os`, except that:

- failure to generate output is reported as specified below, and
- any exception thrown by the call to `vformat` is propagated without regard to the value of `os.exceptions()` and without turning on `ios_base::badbit` in the error state of `os`.

After constructing a `sentry` object, the function initializes an automatic variable via

```
string out = vformat(os.getloc(), fmt, args);
```

If the function is `vprint_unicode` and `os` is a stream that refers to a terminal capable of displaying Unicode which is determined in an implementation-defined manner, writes `out` to the terminal using the native Unicode API; if `out` contains invalid code units, the behavior is undefined and implementations are encouraged to diagnose it. If the native Unicode API is used, the function flushes `os` before writing `out`. Otherwise (if `os` is not such a stream or the function is `vprint_nonunicode`), inserts the character sequence `[out.begin(), out.end())` into `os`. If writing to the terminal or inserting into `os` fails, calls `os.setstate(ios_base::badbit)` (which may throw `ios_base::failure`).

Recommended practice: For `vprint_unicode`, if invoking the native Unicode API requires transcoding, implementations should substitute invalid code units with U+FFFD REPLACEMENT CHARACTER per the Unicode Standard, Chapter 3.9 U+FFFD Substitution in Conversion.

### 31.7.6.4 Unformatted output functions

[ostream.unformatted]

Each unformatted output function begins execution by constructing an object of class `sentry`. If that object returns `true`, while converting to a value of type `bool`, the function endeavors to generate the requested output. If an exception is thrown during output, then `ios_base::badbit` is set<sup>298</sup> in `*this`'s error state. If `(exceptions() & badbit) != 0` then the exception is rethrown. In any case, the unformatted output function ends by destroying the `sentry` object, then, if no exception was thrown, returning the value specified for the unformatted output function.

```
basic_ostream& put(char_type c);
```

*Effects:* Behaves as an unformatted output function (as described above). After constructing a `sentry` object, inserts the character `c`, if possible.<sup>299</sup>

Otherwise, calls `setstate(badbit)` (which may throw `ios_base::failure` (31.5.4.4)).

*Returns:* `*this`.

<sup>298</sup>) This is done without causing an `ios_base::failure` to be thrown.

<sup>299</sup>) Note that this function is not overloaded on types `signed char` and `unsigned char`.

```
basic_ostream& write(const char_type* s, streamsize n);
```

*Effects:* Behaves as an unformatted output function (as described above). After constructing a `sentry` object, obtains characters to insert from successive locations of an array whose first element is designated by `s`.<sup>300</sup> Characters are inserted until either of the following occurs:

- `n` characters are inserted;
- inserting in the output sequence fails (in which case the function calls `setstate(badbit)`, which may throw `ios_base::failure` (31.5.4.4)).

*Returns:* `*this`.

```
basic_ostream& flush();
```

*Effects:* Behaves as an unformatted output function (as described above). If `rdbuf()` is not a null pointer, constructs a `sentry` object. If that object returns `true` when converted to a value of type `bool` the function calls `rdbuf()->pubsync()`. If that function returns `-1` calls `setstate(badbit)` (which may throw `ios_base::failure` (31.5.4.4)). Otherwise, if the `sentry` object returns `false`, does nothing.

*Returns:* `*this`.

### 31.7.6.5 Standard manipulators

[ostream.manip]

Each instantiation of any of the function templates specified in this subclause is a designated addressable function (16.4.5.2.1).

```
template<class charT, class traits>
```

```
basic_ostream<charT, traits>& endl(basic_ostream<charT, traits>& os);
```

*Effects:* Calls `os.put(os.widen('\n'))`, then `os.flush()`.

*Returns:* `os`.

```
template<class charT, class traits>
```

```
basic_ostream<charT, traits>& ends(basic_ostream<charT, traits>& os);
```

*Effects:* Inserts a null character into the output sequence: calls `os.put(charT())`.

*Returns:* `os`.

```
template<class charT, class traits>
```

```
basic_ostream<charT, traits>& flush(basic_ostream<charT, traits>& os);
```

*Effects:* Calls `os.flush()`.

*Returns:* `os`.

```
template<class charT, class traits>
```

```
basic_ostream<charT, traits>& emit_on_flush(basic_ostream<charT, traits>& os);
```

*Effects:* If `os.rdbuf()` is a `basic_syncbuf<charT, traits, Allocator>*`, called `buf` for the purpose of exposition, calls `buf->set_emit_on_sync(true)`. Otherwise this manipulator has no effect.

NOTE To work around the issue that the `Allocator` template argument cannot be deduced, implementations can introduce an intermediate base class to `basic_syncbuf` that manages its `emit_on_sync` flag.

*Returns:* `os`.

```
template<class charT, class traits>
```

```
basic_ostream<charT, traits>& noemit_on_flush(basic_ostream<charT, traits>& os);
```

*Effects:* If `os.rdbuf()` is a `basic_syncbuf<charT, traits, Allocator>*`, called `buf` for the purpose of exposition, calls `buf->set_emit_on_sync(false)`. Otherwise this manipulator has no effect.

*Returns:* `os`.

```
template<class charT, class traits>
```

```
basic_ostream<charT, traits>& flush_emit(basic_ostream<charT, traits>& os);
```

*Effects:* Calls `os.flush()`. Then, if `os.rdbuf()` is a `basic_syncbuf<charT, traits, Allocator>*`, called `buf` for the purpose of exposition, behaves as an unformatted output function (31.7.6.4)

<sup>300</sup>) Note that this function is not overloaded on types `signed char` and `unsigned char`.

of `os`. After constructing a `sentry` object, calls `buf->emit()`. If that call returns `false`, calls `os.setstate(ios_base::badbit)`.

*Returns:* `os`.

### 31.7.6.6 Rvalue stream insertion

[ostream.rvalue]

```
template<class Ostream, class T>
Ostream&& operator<<(Ostream&& os, const T& x);
```

*Constraints:* The expression `os << x` is well-formed when treated as an unevaluated operand and `Ostream` is publicly and unambiguously derived from `ios_base`.

*Effects:* As if by: `os << x`;

*Returns:* `std::move(os)`.

### 31.7.7 Standard manipulators

[std.manip]

The header `<iomanip>` defines several functions that support extractors and inserters that alter information maintained by class `ios_base` and its derived classes.

```
unspecified resetiosflags(ios_base::fmtflags mask);
```

*Returns:* An object of unspecified type such that if `out` is an object of type `basic_ostream<charT, traits>` then the expression `out << resetiosflags(mask)` behaves as if it called `f(out, mask)`, or if `in` is an object of type `basic_istream<charT, traits>` then the expression `in >> resetiosflags(mask)` behaves as if it called `f(in, mask)`, where the function `f` is defined as:<sup>301</sup>

```
void f(ios_base& str, ios_base::fmtflags mask) {
    // reset specified flags
    str.setf(ios_base::fmtflags(0), mask);
}
```

The expression `out << resetiosflags(mask)` has type `basic_ostream<charT, traits>&` and value `out`. The expression `in >> resetiosflags(mask)` has type `basic_istream<charT, traits>&` and value `in`.

```
unspecified setiosflags(ios_base::fmtflags mask);
```

*Returns:* An object of unspecified type such that if `out` is an object of type `basic_ostream<charT, traits>` then the expression `out << setiosflags(mask)` behaves as if it called `f(out, mask)`, or if `in` is an object of type `basic_istream<charT, traits>` then the expression `in >> setiosflags(mask)` behaves as if it called `f(in, mask)`, where the function `f` is defined as:

```
void f(ios_base& str, ios_base::fmtflags mask) {
    // set specified flags
    str.setf(mask);
}
```

The expression `out << setiosflags(mask)` has type `basic_ostream<charT, traits>&` and value `out`. The expression `in >> setiosflags(mask)` has type `basic_istream<charT, traits>&` and value `in`.

```
unspecified setbase(int base);
```

*Returns:* An object of unspecified type such that if `out` is an object of type `basic_ostream<charT, traits>` then the expression `out << setbase(base)` behaves as if it called `f(out, base)`, or if `in` is an object of type `basic_istream<charT, traits>` then the expression `in >> setbase(base)` behaves as if it called `f(in, base)`, where the function `f` is defined as:

```
void f(ios_base& str, int base) {
    // set basefield
    str.setf(base == 8 ? ios_base::oct :
            base == 10 ? ios_base::dec :
            base == 16 ? ios_base::hex :
```

<sup>301</sup>) The expression `cin >> resetiosflags(ios_base::skipws)` clears `ios_base::skipws` in the format flags stored in the `basic_istream<charT, traits>` object `cin` (the same as `cin >> noskipws`), and the expression `cout << resetiosflags(ios_base::showbase)` clears `ios_base::showbase` in the format flags stored in the `basic_ostream<charT, traits>` object `cout` (the same as `cout << noshowbase`).

```

        ios_base::fmtflags(0), ios_base::basefield);
    }

```

The expression `out << setbase(base)` has type `basic_ostream<charT, traits>&` and value `out`.  
The expression `in >> setbase(base)` has type `basic_istream<charT, traits>&` and value `in`.

*unspecified* `setfill(char_type c);`

*Returns:* An object of unspecified type such that if `out` is an object of type `basic_ostream<charT, traits>` and `c` has type `charT` then the expression `out << setfill(c)` behaves as if it called `f(out, c)`, where the function `f` is defined as:

```

template<class charT, class traits>
void f(basic_ios<charT, traits>& str, charT c) {
    // set fill character
    str.fill(c);
}

```

The expression `out << setfill(c)` has type `basic_ostream<charT, traits>&` and value `out`.

*unspecified* `setprecision(int n);`

*Returns:* An object of unspecified type such that if `out` is an object of type `basic_ostream<charT, traits>` then the expression `out << setprecision(n)` behaves as if it called `f(out, n)`, or if `in` is an object of type `basic_istream<charT, traits>` then the expression `in >> setprecision(n)` behaves as if it called `f(in, n)`, where the function `f` is defined as:

```

void f(ios_base& str, int n) {
    // set precision
    str.precision(n);
}

```

The expression `out << setprecision(n)` has type `basic_ostream<charT, traits>&` and value `out`.  
The expression `in >> setprecision(n)` has type `basic_istream<charT, traits>&` and value `in`.

*unspecified* `setw(int n);`

*Returns:* An object of unspecified type such that if `out` is an instance of `basic_ostream<charT, traits>` then the expression `out << setw(n)` behaves as if it called `f(out, n)`, or if `in` is an object of type `basic_istream<charT, traits>` then the expression `in >> setw(n)` behaves as if it called `f(in, n)`, where the function `f` is defined as:

```

void f(ios_base& str, int n) {
    // set width
    str.width(n);
}

```

The expression `out << setw(n)` has type `basic_ostream<charT, traits>&` and value `out`. The expression `in >> setw(n)` has type `basic_istream<charT, traits>&` and value `in`.

### 31.7.8 Extended manipulators

[ext.manip]

The header `<iomanip>` defines several functions that support extractors and inserters that allow for the parsing and formatting of sequences and values for money and time.

```
template<class moneyT> unspecified get_money(moneyT& mon, bool intl = false);
```

*Mandates:* The type `moneyT` is either `long double` or a specialization of the `basic_string` template (Clause 23).

*Effects:* The expression `in >> get_money(mon, intl)` described below behaves as a formatted input function (31.7.5.3.1).

*Returns:* An object of unspecified type such that if `in` is an object of type `basic_istream<charT, traits>` then the expression `in >> get_money(mon, intl)` behaves as if it called `f(in, mon, intl)`, where the function `f` is defined as:

```

template<class charT, class traits, class moneyT>
void f(basic_ios<charT, traits>& str, moneyT& mon, bool intl) {
    using Iter    = istreambuf_iterator<charT, traits>;
    using MoneyGet = money_get<charT, Iter>;
}

```

```

ios_base::iostate err = ios_base::goodbit;
const MoneyGet& mg = use_facet<MoneyGet>(str.getloc());

mg.get(Iter(str.rdbuf()), Iter(), intl, str, err, mon);

if (ios_base::goodbit != err)
    str.setstate(err);
}

```

The expression in `>> get_money(mon, intl)` has type `basic_istream<charT, traits>&` and value `in`.

```
template<class moneyT> unspecified put_money(const moneyT& mon, bool intl = false);
```

*Mandates:* The type `moneyT` is either `long double` or a specialization of the `basic_string` template (Clause 23).

*Returns:* An object of unspecified type such that if `out` is an object of type `basic_ostream<charT, traits>` then the expression `out << put_money(mon, intl)` behaves as a formatted output function (31.7.6.3.1) that calls `f(out, mon, intl)`, where the function `f` is defined as:

```

template<class charT, class traits, class moneyT>
void f(basic_ios<charT, traits>& str, const moneyT& mon, bool intl) {
    using Iter      = ostreambuf_iterator<charT, traits>;
    using MoneyPut  = money_put<charT, Iter>;

    const MoneyPut& mp = use_facet<MoneyPut>(str.getloc());
    const Iter end = mp.put(Iter(str.rdbuf()), intl, str, str.fill(), mon);

    if (end.failed())
        str.setstate(ios_base::badbit);
}

```

The expression `out << put_money(mon, intl)` has type `basic_ostream<charT, traits>&` and value `out`.

```
template<class charT> unspecified get_time(tm* tmb, const charT* fmt);
```

*Preconditions:* The argument `tmb` is a valid pointer to an object of type `tm`, and `[fmt, fmt + char_traits<charT>::length(fmt))` is a valid range.

*Returns:* An object of unspecified type such that if `in` is an object of type `basic_istream<charT, traits>` then the expression `in >> get_time(tmb, fmt)` behaves as if it called `f(in, tmb, fmt)`, where the function `f` is defined as:

```

template<class charT, class traits>
void f(basic_ios<charT, traits>& str, tm* tmb, const charT* fmt) {
    using Iter      = istreambuf_iterator<charT, traits>;
    using TimeGet   = time_get<charT, Iter>;

    ios_base::iostate err = ios_base::goodbit;
    const TimeGet& tg = use_facet<TimeGet>(str.getloc());

    tg.get(Iter(str.rdbuf()), Iter(), str, err, tmb,
          fmt, fmt + traits::length(fmt));

    if (err != ios_base::goodbit)
        str.setstate(err);
}

```

The expression `in >> get_time(tmb, fmt)` has type `basic_istream<charT, traits>&` and value `in`.

```
template<class charT> unspecified put_time(const tm* tmb, const charT* fmt);
```

*Preconditions:* The argument `tmb` is a valid pointer to an object of type `tm`, and `[fmt, fmt + char_traits<charT>::length(fmt))` is a valid range.

*Returns:* An object of unspecified type such that if `out` is an object of type `basic_ostream<charT, traits>` then the expression `out << put_time(tmb, fmt)` behaves as if it called `f(out, tmb, fmt)`, where the function `f` is defined as:

```
template<class charT, class traits>
void f(basic_ios<charT, traits>& str, const tm* tmb, const charT* fmt) {
    using Iter    = ostreambuf_iterator<charT, traits>;
    using TimePut = time_put<charT, Iter>;

    const TimePut& tp = use_facet<TimePut>(str.getloc());
    const Iter end = tp.put(Iter(str.rdbuf()), str, str.fill(), tmb,
        fmt, fmt + traits::length(fmt));

    if (end.failed())
        str.setstate(ios_base::badbit);
}
```

The expression `out << put_time(tmb, fmt)` has type `basic_ostream<charT, traits>&` and value `out`.

### 31.7.9 Quoted manipulators

[quoted.manip]

NOTE Quoted manipulators provide string insertion and extraction of quoted strings (for example, XML and CSV formats). Quoted manipulators are useful in ensuring that the content of a string with embedded spaces remains unchanged if inserted and then extracted via stream I/O.

```
template<class charT>
    unspecified quoted(const charT* s, charT delim = charT('\"'), charT escape = charT('\\'));
template<class charT, class traits, class Allocator>
    unspecified quoted(const basic_string<charT, traits, Allocator>& s,
        charT delim = charT('\"'), charT escape = charT('\\'));
template<class charT, class traits>
    unspecified quoted(basic_string_view<charT, traits> s,
        charT delim = charT('\"'), charT escape = charT('\\'));
```

*Returns:* An object of unspecified type such that if `out` is an instance of `basic_ostream` with member type `char_type` the same as `charT` and with member type `traits_type`, which in the second and third forms is the same as `traits`, then the expression `out << quoted(s, delim, escape)` behaves as a formatted output function (31.7.6.3.1) of `out`. This forms a character sequence `seq`, initially consisting of the following elements:

- `delim`.
- Each character in `s`. If the character to be output is equal to `escape` or `delim`, as determined by `traits_type::eq`, first output `escape`.
- `delim`.

Let `x` be the number of elements initially in `seq`. Then padding is determined for `seq` as described in 31.7.6.3.1, `seq` is inserted as if by calling `out.rdbuf()->sputn(seq, n)`, where `n` is the larger of `out.width()` and `x`, and `out.width(0)` is called. The expression `out << quoted(s, delim, escape)` has type `basic_ostream<charT, traits>&` and value `out`.

```
template<class charT, class traits, class Allocator>
    unspecified quoted(basic_string<charT, traits, Allocator>& s,
        charT delim = charT('\"'), charT escape = charT('\\'));
```

*Returns:* An object of unspecified type such that:

- If `in` is an instance of `basic_istream` with member types `char_type` and `traits_type` the same as `charT` and `traits`, respectively, then the expression `in >> quoted(s, delim, escape)` behaves as if it extracts the following characters from `in` using `operator>>(basic_istream<charT, traits>&, charT&)` (31.7.5.3.3) which may throw `ios_base::failure` (31.5.2.2.1):
  - If the first character extracted is equal to `delim`, as determined by `traits_type::eq`, then:
    - Turn off the `skipws` flag.
    - `s.clear()`

- Until an unescaped `delim` character is reached or `!in`, extract characters from `in` and append them to `s`, except that if an `escape` is reached, ignore it and append the next character to `s`.
- Discard the final `delim` character.
- Restore the `skipws` flag to its original value.
- Otherwise, `in >> s`.
- If `out` is an instance of `basic_ostream` with member types `char_type` and `traits_type` the same as `charT` and `traits`, respectively, then the expression `out << quoted(s, delim, escape)` behaves as specified for the `const basic_string<charT, traits, Allocator>&` overload of the `quoted` function.
- The expression `in >> quoted(s, delim, escape)` has type `basic_istream<charT, traits>&` and value `in`.
- The expression `out << quoted(s, delim, escape)` has type `basic_ostream<charT, traits>&` and value `out`.

### 31.7.10 Print functions

[print.fun]

```
template<class... Args>
void print(format_string<Args...> fmt, Args&&... args);
```

*Effects:* Equivalent to:

```
print(stdout, fmt, std::forward<Args>(args)...);
```

```
template<class... Args>
void print(FILE* stream, format_string<Args...> fmt, Args&&... args);
```

*Effects:* If the ordinary literal encoding (5.3) is UTF-8, equivalent to:

```
vprint_unicode(stream, fmt.str, make_format_args(std::forward<Args>(args)...));
```

Otherwise, equivalent to:

```
vprint_nonunicode(stream, fmt.str, make_format_args(std::forward<Args>(args)...));
```

```
template<class... Args>
void println(format_string<Args...> fmt, Args&&... args);
```

*Effects:* Equivalent to:

```
println(stdout, fmt, std::forward<Args>(args)...);
```

```
template<class... Args>
void println(FILE* stream, format_string<Args...> fmt, Args&&... args);
```

*Effects:* Equivalent to:

```
print(stream, "{}\n", format(fmt, std::forward<Args>(args)...));
```

```
void vprint_unicode(string_view fmt, format_args args);
```

*Effects:* Equivalent to:

```
vprint_unicode(stdout, fmt, args);
```

```
void vprint_unicode(FILE* stream, string_view fmt, format_args args);
```

*Preconditions:* `stream` is a valid pointer to an output C stream.

*Effects:* The function initializes an automatic variable via

```
string out = vformat(fmt, args);
```

If `stream` refers to a terminal capable of displaying Unicode, writes `out` to the terminal using the native Unicode API; if `out` contains invalid code units, the behavior is undefined and implementations are encouraged to diagnose it. Otherwise writes `out` to `stream` unchanged. If the native Unicode API is used, the function flushes `stream` before writing `out`.

NOTE 1 On POSIX and Windows, `stream` referring to a terminal means that, respectively, `isatty(fileno(stream))` and `GetConsoleMode(_get_osfhandle(_fileno(stream)), ...)` return nonzero.

NOTE 2 On Windows, the native Unicode API is `WriteConsoleW`.

*Throws:* Any exception thrown by the call to `vformat` (22.14.3). `system_error` if writing to the terminal or `stream` fails. May throw `bad_alloc`.

Recommended practice: If invoking the native Unicode API requires transcoding, implementations should substitute invalid code units with U+FFFD REPLACEMENT CHARACTER per the Unicode Standard, Chapter 3.9 U+FFFD Substitution in Conversion.

```
void vprint_nonunicode(string_view fmt, format_args args);
```

*Effects:* Equivalent to:

```
vprint_nonunicode(stdout, fmt, args);
```

```
void vprint_nonunicode(FILE* stream, string_view fmt, format_args args);
```

*Preconditions:* `stream` is a valid pointer to an output C stream.

*Effects:* Writes the result of `vformat(fmt, args)` to `stream`.

*Throws:* Any exception thrown by the call to `vformat` (22.14.3). `system_error` if writing to `stream` fails. May throw `bad_alloc`.

## 31.8 String-based streams

[string.streams]

### 31.8.1 Header <sstream> synopsis

[sstream.syn]

```
namespace std {
    template<class charT, class traits = char_traits<charT>,
             class Allocator = allocator<charT>>
        class basic_stringbuf;

    template<class charT, class traits, class Allocator>
        void swap(basic_stringbuf<charT, traits, Allocator>& x,
                  basic_stringbuf<charT, traits, Allocator>& y) noexcept(noexcept(x.swap(y)));

    using stringbuf = basic_stringbuf<char>;
    using wstringbuf = basic_stringbuf<wchar_t>;

    template<class charT, class traits = char_traits<charT>,
             class Allocator = allocator<charT>>
        class basic_istreamstream;

    template<class charT, class traits, class Allocator>
        void swap(basic_istreamstream<charT, traits, Allocator>& x,
                  basic_istreamstream<charT, traits, Allocator>& y);

    using istringstream = basic_istreamstream<char>;
    using wistringstream = basic_istreamstream<wchar_t>;

    template<class charT, class traits = char_traits<charT>,
             class Allocator = allocator<charT>>
        class basic_ostreamstream;

    template<class charT, class traits, class Allocator>
        void swap(basic_ostreamstream<charT, traits, Allocator>& x,
                  basic_ostreamstream<charT, traits, Allocator>& y);

    using ostreamstream = basic_ostreamstream<char>;
    using wostreamstream = basic_ostreamstream<wchar_t>;

    template<class charT, class traits = char_traits<charT>,
             class Allocator = allocator<charT>>
        class basic_stringstream;

    template<class charT, class traits, class Allocator>
        void swap(basic_stringstream<charT, traits, Allocator>& x,
                  basic_stringstream<charT, traits, Allocator>& y);
```

```

using stringstream = basic_stringstream<char>;
using wstringstream = basic_stringstream<wchar_t>;
}

```

The header <sstream> defines four class templates and eight types that associate stream buffers with objects of class `basic_string`, as described in 23.4.

## 31.8.2 Class template `basic_stringbuf`

[stringbuf]

### 31.8.2.1 General

[stringbuf.general]

```

namespace std {
    template<class charT, class traits = char_traits<charT>,
            class Allocator = allocator<charT>>
    class basic_stringbuf : public basic_streambuf<charT, traits> {
    public:
        using char_type      = charT;
        using int_type       = typename traits::int_type;
        using pos_type       = typename traits::pos_type;
        using off_type       = typename traits::off_type;
        using traits_type    = traits;
        using allocator_type = Allocator;

        // 31.8.2.2, constructors
        basic_stringbuf() : basic_stringbuf(ios_base::in | ios_base::out) {}
        explicit basic_stringbuf(ios_base::openmode which);
        explicit basic_stringbuf(
            const basic_string<charT, traits, Allocator>& s,
            ios_base::openmode which = ios_base::in | ios_base::out);
        explicit basic_stringbuf(const Allocator& a)
            : basic_stringbuf(ios_base::in | ios_base::out, a) {}
        basic_stringbuf(ios_base::openmode which, const Allocator& a);
        explicit basic_stringbuf(
            basic_string<charT, traits, Allocator>&& s,
            ios_base::openmode which = ios_base::in | ios_base::out);
        template<class SAlloc>
        basic_stringbuf(
            const basic_string<charT, traits, SAlloc>& s, const Allocator& a)
            : basic_stringbuf(s, ios_base::in | ios_base::out, a) {}
        template<class SAlloc>
        basic_stringbuf(
            const basic_string<charT, traits, SAlloc>&& s,
            ios_base::openmode which, const Allocator& a);
        template<class SAlloc>
        explicit basic_stringbuf(
            const basic_string<charT, traits, SAlloc>& s,

        basic_string_view<charT, traits> view() const noexcept;
    };
}

```

```

void str(const basic_string<charT, traits, Allocator>& s);
template<class SAlloc>
    void str(const basic_string<charT, traits, SAlloc>& s);
void str(basic_string<charT, traits, Allocator>&& s);

protected:
    // 31.8.2.5, overridden virtual functions
    int_type underflow() override;
    int_type pbackfail(int_type c = traits::eof()) override;
    int_type overflow (int_type c = traits::eof()) override;
    basic_streambuf<charT, traits>* setbuf(charT*, streamsize) override;

    pos_type seekoff(off_type off, ios_base::seekdir way,
                    ios_base::openmode which
                    = ios_base::in | ios_base::out) override;
    pos_type seekpos(pos_type sp,
                    ios_base::openmode which
                    = ios_base::in | ios_base::out) override;

private:
    ios_base::openmode mode;                // exposition only
    basic_string<charT, traits, Allocator> buf; // exposition only
    void init_buf_ptrs();                   // exposition only
};

```

The class `basic_stringbuf` is derived from `basic_streambuf` to associate possibly the input sequence and possibly the output sequence with a sequence of arbitrary *characters*. The sequence can be initialized from, or made available as, an object of class `basic_string`.

For the sake of exposition, the maintained data and internal pointer initialization is presented here as:

- `ios_base::openmode mode`, has `in` set if the input sequence can be read, and `out` set if the output sequence can be written.
- `basic_string<charT, traits, Allocator> buf` contains the underlying character sequence.
- `init_buf_ptrs()` sets the base class' `get` area (31.6.3.4.2) and `put` area (31.6.3.4.3) pointers after initializing, moving from, or assigning to `buf` accordingly.

### 31.8.2.2 Constructors

[stringbuf.cons]

```
explicit basic_stringbuf(ios_base::openmode which);
```

*Effects:* Initializes the base class with `basic_streambuf()` (31.6.3.2), and `mode` with `which`. It is implementation-defined whether the sequence pointers (`eback()`, `gptra()`, `egptr()`, `pbase()`, `pptr()`, `epptr()`) are initialized to null pointers.

*Postconditions:* `str().empty()` is true.

```
explicit basic_stringbuf(
    const basic_string<charT, traits, Allocator>& s,
    ios_base::openmode which = ios_base::in | ios_base::out);
```

*Effects:* Initializes the base class with `basic_streambuf()` (31.6.3.2), `mode` with `which`, and `buf` with `s`, then calls `init_buf_ptrs()`.

```
basic_stringbuf(ios_base::openmode which, const Allocator &a);
```

*Effects:* Initializes the base class with `basic_streambuf()` (31.6.3.2), `mode` with `which`, and `buf` with `a`, then calls `init_buf_ptrs()`.

*Postconditions:* `str().empty()` is true.

```
explicit basic_stringbuf(
    basic_string<charT, traits, Allocator>&& s,
    ios_base::openmode which = ios_base::in | ios_base::out);
```

*Effects:* Initializes the base class with `basic_streambuf()` (31.6.3.2), `mode` with `which`, and `buf` with `std::move(s)`, then calls `init_buf_ptrs()`.

```
template<class SAlloc>
basic_stringbuf(
    const basic_string<charT, traits, SAlloc>& s,
    ios_base::openmode which, const Allocator& a);
```

*Effects:* Initializes the base class with `basic_streambuf()` (31.6.3.2), mode with `which`, and `buf` with `{s,a}`, then calls `init_buf_ptrs()`.

```
template<class SAlloc>
explicit basic_stringbuf(
    const basic_string<charT, traits, SAlloc>& s,
    ios_base::openmode which = ios_base::in | ios_base::out);
```

*Constraints:* `is_same_v<SAlloc, Allocator>` is false.

*Effects:* Initializes the base class with `basic_streambuf()` (31.6.3.2), mode with `which`, and `buf` with `s`, then calls `init_buf_ptrs()`.

```
basic_stringbuf(basic_stringbuf&& rhs);
basic_stringbuf(basic_stringbuf&& rhs, const Allocator& a);
```

*Effects:* Copy constructs the base class from `rhs` and initializes `mode` with `rhs.mode`. In the first form `buf` is initialized from `std::move(rhs).str()`. In the second form `buf` is initialized from `{std::move(rhs).str(), a}`. It is implementation-defined whether the sequence pointers in `*this` (`eback()`, `gptr()`, `egptr()`, `pbase()`, `pptr()`, `epptr()`) obtain the values which `rhs` had.

*Postconditions:* Let `rhs_p` refer to the state of `rhs` just prior to this construction and let `rhs_a` refer to the state of `rhs` just after this construction.

- `str() == rhs_p.str()`
- `gptr() - eback() == rhs_p.gptr() - rhs_p.eback()`
- `egptr() - eback() == rhs_p.egptr() - rhs_p.eback()`
- `pptr() - pbase() == rhs_p.pptr() - rhs_p.pbase()`
- `epptr() - pbase() == rhs_p.epptr() - rhs_p.pbase()`
- if (`eback()`) `eback() != rhs_a.eback()`
- if (`gptr()`) `gptr() != rhs_a.gptr()`
- if (`egptr()`) `egptr() != rhs_a.egptr()`
- if (`pbase()`) `pbase() != rhs_a.pbase()`
- if (`pptr()`) `pptr() != rhs_a.pptr()`
- if (`epptr()`) `epptr() != rhs_a.epptr()`
- `getloc() == rhs_p.getloc()`
- `rhs` is empty but usable, as if `std::move(rhs).str()` was called.

### 31.8.2.3 Assignment and swap

[stringbuf.assign]

```
basic_stringbuf& operator=(basic_stringbuf&& rhs);
```

*Effects:* After the move assignment `*this` has the observable state it would have had if it had been move constructed from `rhs` (see 31.8.2.2).

*Returns:* `*this`.

```
void swap(basic_stringbuf& rhs) noexcept(see below);
```

*Preconditions:* `allocator_traits<Allocator>::propagate_on_container_swap::value` is true or `get_allocator() == rhs.get_allocator()` is true.

*Effects:* Exchanges the state of `*this` and `rhs`.

*Remarks:* The exception specification is equivalent to:

```
allocator_traits<Allocator>::propagate_on_container_swap::value ||
allocator_traits<Allocator>::is_always_equal::value.
```

```
template<class charT, class traits, class Allocator>
void swap(basic_stringbuf<charT, traits, Allocator>& x,
         basic_stringbuf<charT, traits, Allocator>& y) noexcept(noexcept(x.swap(y)));
```

*Effects:* Equivalent to: `x.swap(y)`.

### 31.8.2.4 Member functions

[stringbuf.members]

The member functions getting the underlying character sequence all refer to a `high_mark` value, where `high_mark` represents the position one past the highest initialized character in the buffer. Characters can be initialized by writing to the stream, by constructing the `basic_stringbuf` passing a `basic_string` argument, or by calling one of the `str` member functions passing a `basic_string` as an argument. In the latter case, all characters initialized prior to the call are now considered uninitialized (except for those characters re-initialized by the new `basic_string`).

```
void init_buf_ptrs(); // exposition only
```

*Effects:* Initializes the input and output sequences from `buf` according to mode.

*Postconditions:*

- If `ios_base::out` is set in mode, `pbase()` points to `buf.front()` and `epptr() >= pbase() + buf.size()` is true;
  - in addition, if `ios_base::ate` is set in mode, `pptr() == pbase() + buf.size()` is true,
  - otherwise `pptr() == pbase()` is true.
- If `ios_base::in` is set in mode, `eback()` points to `buf.front()`, and `(gptr() == eback() && egptr() == eback() + buf.size())` is true.

NOTE 1 For efficiency reasons, stream buffer operations can violate invariants of `buf` while it is held encapsulated in the `basic_stringbuf`, e.g., by writing to characters in the range `[buf.data() + buf.size(), buf.data() + buf.capacity())`. All operations retrieving a `basic_string` from `buf` ensure that the `basic_string` invariants hold on the returned value.

```
allocator_type get_allocator() const noexcept;
```

*Returns:* `buf.get_allocator()`.

```
basic_string<charT, traits, Allocator> str() const &;
```

*Effects:* Equivalent to:

```
return basic_string<charT, traits, Allocator>(view(), get_allocator());
```

```
template<class SAlloc>
```

```
basic_string<charT, traits, SAlloc> str(const SAlloc& sa) const;
```

*Constraints:* `SAlloc` is a type that qualifies as an allocator (24.2.2.2).

*Effects:* Equivalent to:

```
return basic_string<charT, traits, SAlloc>(view(), sa);
```

```
basic_string<charT, traits, Allocator> str() &&;
```

*Postconditions:* The underlying character sequence `buf` is empty and `pbase()`, `pptr()`, `epptr()`, `eback()`, `gptr()`, and `egptr()` are initialized as if by calling `init_buf_ptrs()` with an empty `buf`.

*Returns:* A `basic_string<charT, traits, Allocator>` object move constructed from the `basic_stringbuf`'s underlying character sequence in `buf`. This can be achieved by first adjusting `buf` to have the same content as `view()`.

```
basic_string_view<charT, traits> view() const noexcept;
```

Let `sv` be `basic_string_view<charT, traits>`.

*Returns:* A `sv` object referring to the `basic_stringbuf`'s underlying character sequence in `buf`:

- If `ios_base::out` is set in mode, then `sv(pbase(), high_mark-pbase())` is returned.
- Otherwise, if `ios_base::in` is set in mode, then `sv(eback(), egptr()-eback())` is returned.
- Otherwise, `sv()` is returned.

NOTE 2 Using the returned `sv` object after destruction or invalidation of the character sequence underlying `*this` is undefined behavior, unless `sv.empty()` is `true`.

```
void str(const basic_string<charT, traits, Allocator>& s);
```

*Effects:* Equivalent to:

```
buf = s;
init_buf_ptrs();
```

```
template<class SAlloc>
```

```
void str(const basic_string<charT, traits, SAlloc>& s);
```

*Constraints:* `is_same_v<SAlloc, Allocator>` is `false`.

*Effects:* Equivalent to:

```
buf = s;
init_buf_ptrs();
```

```
void str(basic_string<charT, traits, Allocator>&& s);
```

*Effects:* Equivalent to:

```
buf = std::move(s);
init_buf_ptrs();
```

### 31.8.2.5 Overridden virtual functions

[`stringbuf.virtuals`]

```
int_type underflow() override;
```

*Returns:* If the input sequence has a read position available, returns `traits::to_int_type(*gptr())`. Otherwise, returns `traits::eof()`. Any character in the underlying buffer which has been initialized is considered to be part of the input sequence.

```
int_type pbackfail(int_type c = traits::eof()) override;
```

*Effects:* Puts back the character designated by `c` to the input sequence, if possible, in one of three ways:

- If `traits::eq_int_type(c, traits::eof())` returns `false` and if the input sequence has a putback position available, and if `traits::eq(to_char_type(c), gptr()[-1])` returns `true`, assigns `gptr() - 1` to `gptr()`.

Returns: `c`.

- If `traits::eq_int_type(c, traits::eof())` returns `false` and if the input sequence has a putback position available, and if `mode & ios_base::out` is nonzero, assigns `c` to `*--gptr()`.

Returns: `c`.

- If `traits::eq_int_type(c, traits::eof())` returns `true` and if the input sequence has a putback position available, assigns `gptr() - 1` to `gptr()`.

Returns: `traits::not_eof(c)`.

*Returns:* As specified above, or `traits::eof()` to indicate failure.

*Remarks:* If the function can succeed in more than one of these ways, it is unspecified which way is chosen.

```
int_type overflow(int_type c = traits::eof()) override;
```

*Effects:* Appends the character designated by `c` to the output sequence, if possible, in one of two ways:

- If `traits::eq_int_type(c, traits::eof())` returns `false` and if either the output sequence has a write position available or the function makes a write position available (as described below), the function calls `sputc(c)`.

Signals success by returning `c`.

- If `traits::eq_int_type(c, traits::eof())` returns `true`, there is no character to append.

Signals success by returning a value other than `traits::eof()`.

*Returns:* As specified above, or `traits::eof()` to indicate failure.

*Remarks:* The function can alter the number of write positions available as a result of any call.

The function can make a write position available only if `ios_base::out` is set in `mode`. To make a write position available, the function reallocates (or initially allocates) an array object with a sufficient number of elements to hold the current array object (if any), plus at least one additional write position. If `ios_base::in` is set in `mode`, the function alters the read end pointer `egptr()` to point just past the new write position.

```
pos_type seekoff(off_type off, ios_base::seekdir way,
                ios_base::openmode which
                = ios_base::in | ios_base::out) override;
```

*Effects:* Alters the stream position within one of the controlled sequences, if possible, as indicated in Table 126.

Table 126 — `seekoff` positioning [tab:stringbuf.seekoff.pos]

| Conditions                                                                                                                                                                          | Result                                            |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------|
| <code>ios_base::in</code> is set in <code>which</code>                                                                                                                              | positions the input sequence                      |
| <code>ios_base::out</code> is set in <code>which</code>                                                                                                                             | positions the output sequence                     |
| both <code>ios_base::in</code> and <code>ios_base::out</code> are set in <code>which</code> and either<br><code>way == ios_base::beg</code> or<br><code>way == ios_base::end</code> | positions both the input and the output sequences |
| Otherwise                                                                                                                                                                           | the positioning operation fails.                  |

For a sequence to be positioned, the function determines `newoff` as indicated in Table 127. If the sequence's next pointer (either `gptr()` or `pptr()`) is a null pointer and `newoff` is nonzero, the positioning operation fails.

Table 127 — `newoff` values [tab:stringbuf.seekoff.newoff]

| Condition                         | <code>newoff</code> Value                                                            |
|-----------------------------------|--------------------------------------------------------------------------------------|
| <code>way == ios_base::beg</code> | 0                                                                                    |
| <code>way == ios_base::cur</code> | the next pointer minus the beginning pointer ( <code>xnext - xbeg</code> ).          |
| <code>way == ios_base::end</code> | the high mark pointer minus the beginning pointer ( <code>high_mark - xbeg</code> ). |

If  $(\text{newoff} + \text{off}) < 0$ , or if `newoff + off` refers to an uninitialized character (31.8.2.4), the positioning operation fails. Otherwise, the function assigns `xbeg + newoff + off` to the next pointer `xnext`.

*Returns:* `pos_type(newoff)`, constructed from the resultant offset `newoff` (of type `off_type`), that stores the resultant stream position, if possible. If the positioning operation fails, or if the constructed object cannot represent the resultant stream position, the return value is `pos_type(off_type(-1))`.

```
pos_type seekpos(pos_type sp,
                ios_base::openmode which
                = ios_base::in | ios_base::out) override;
```

*Effects:* Equivalent to `seekoff(off_type(sp), ios_base::beg, which)`.

*Returns:* `sp` to indicate success, or `pos_type(off_type(-1))` to indicate failure.

```
basic_streambuf<charT, traits>* setbuf(charT* s, streamsize n) override;
```

*Effects:* implementation-defined, except that `setbuf(0, 0)` has no effect.

*Returns:* `this`.

31.8.3 Class template `basic_istream`

[istream]

## 31.8.3.1 General

[istream.general]

```

namespace std {
    template<class charT, class traits = char_traits<charT>,
            class Allocator = allocator<charT>>
    class basic_istream : public basic_istream<charT, traits> {
    public:
        using char_type      = charT;
        using int_type        = typename traits::int_type;
        using pos_type        = typename traits::pos_type;
        using off_type        = typename traits::off_type;
        using traits_type     = traits;
        using allocator_type  = Allocator;

        // 31.8.3.2, constructors
        basic_istream() : basic_istream(ios_base::in) {}
        explicit basic_istream(ios_base::openmode which);
        explicit basic_istream(
            const basic_string<charT, traits, Allocator>& s,
            ios_base::openmode which = ios_base::in);
        basic_istream(ios_base::openmode which, const Allocator& a);
        explicit basic_istream(
            basic_string<charT, traits, Allocator>&& s,
            ios_base::openmode which = ios_base::in);
        template<class SAlloc>
        basic_istream(
            const basic_string<charT, traits, SAlloc>& s, const Allocator& a)
            : basic_istream(s, ios_base::in, a) {}
        template<class SAlloc>
        basic_istream(
            const basic_string<charT, traits, SAlloc>& s,
            ios_base::openmode which, const Allocator& a);
        template<class SAlloc>
        explicit basic_istream(
            const basic_string<charT, traits, SAlloc>& s,
            ios_base::openmode which = ios_base::in);
        basic_istream(const basic_istream&) = delete;
        basic_istream(basic_istream&& rhs);

        basic_istream& operator=(const basic_istream&) = delete;
        basic_istream& operator=(basic_istream&& rhs);

        // 31.8.3.3, swap
        void swap(basic_istream& rhs);

        // 31.8.3.4, members
        basic_stringbuf<charT, traits, Allocator>* rdbuf() const;
        basic_string<charT, traits, Allocator> str() const &;
        template<class SAlloc>
        basic_string<charT, traits, SAlloc> str(const SAlloc& sa) const;
        basic_string<charT, traits, Allocator> str() &&;
        basic_string_view<charT, traits> view() const noexcept;

        void str(const basic_string<charT, traits, Allocator>& s);
        template<class SAlloc>
        void str(const basic_string<charT, traits, SAlloc>& s);
        void str(basic_string<charT, traits, Allocator>&& s);

    private:
        basic_stringbuf<charT, traits, Allocator> sb;    // exposition only
    };
}

```

The class `basic_istreamstream<charT, traits, Allocator>` supports reading objects of class `basic_string<charT, traits, Allocator>`. It uses a `basic_stringbuf<charT, traits, Allocator>` object to control the associated storage. For the sake of exposition, the maintained data is presented here as:

— `sb`, the `stringbuf` object.

### 31.8.3.2 Constructors

[istreamstream.cons]

```
explicit basic_istreamstream(ios_base::openmode which);
```

*Effects:* Initializes the base class with `basic_istream<charT, traits>(addressof(sb))` (31.7.5.2) and `sb` with `basic_stringbuf<charT, traits, Allocator>(which | ios_base::in)` (31.8.2.2).

```
explicit basic_istreamstream(
    const basic_string<charT, traits, Allocator>& s,
    ios_base::openmode which = ios_base::in);
```

*Effects:* Initializes the base class with `basic_istream<charT, traits>(addressof(sb))` (31.7.5.2) and `sb` with `basic_stringbuf<charT, traits, Allocator>(s, which | ios_base::in)` (31.8.2.2).

```
basic_istreamstream(ios_base::openmode which, const Allocator& a);
```

*Effects:* Initializes the base class with `basic_istream<charT, traits>(addressof(sb))` (31.7.5.2) and `sb` with `basic_stringbuf<charT, traits, Allocator>(which | ios_base::in, a)` (31.8.2.2).

```
explicit basic_istreamstream(
    basic_string<charT, traits, Allocator>&& s,
    ios_base::openmode which = ios_base::in);
```

*Effects:* Initializes the base class with `basic_istream<charT, traits>(addressof(sb))` (31.7.5.2) and `sb` with `basic_stringbuf<charT, traits, Allocator>(std::move(s), which | ios_base::in)` (31.8.2.2).

```
template<class SAlloc>
basic_istreamstream(
    const basic_string<charT, traits, SAlloc>& s,
    ios_base::openmode which, const Allocator& a);
```

*Effects:* Initializes the base class with `basic_istream<charT, traits>(addressof(sb))` (31.7.5.2) and `sb` with `basic_stringbuf<charT, traits, Allocator>(s, which | ios_base::in, a)` (31.8.2.2).

```
template<class SAlloc>
explicit basic_istreamstream(
    const basic_string<charT, traits, SAlloc>& s,
    ios_base::openmode which = ios_base::in);
```

*Effects:* Initializes the base class with `basic_istream<charT, traits>(addressof(sb))` (31.7.5.2) and `sb` with `basic_stringbuf<charT, traits, Allocator>(s, which | ios_base::in)` (31.8.2.2).

```
basic_istreamstream(basic_istreamstream&& rhs);
```

*Effects:* Move constructs from the rvalue `rhs`. This is accomplished by move constructing the base class, and the contained `basic_stringbuf`. Then calls `basic_istream<charT, traits>::set_rdbuf(addressof(sb))` to install the contained `basic_stringbuf`.

### 31.8.3.3 Swap

[istreamstream.swap]

```
void swap(basic_istreamstream& rhs);
```

*Effects:* Equivalent to:

```
    basic_istream<charT, traits>::swap(rhs);
    sb.swap(rhs.sb);
```

```
template<class charT, class traits, class Allocator>
void swap(basic_istreamstream<charT, traits, Allocator>& x,
    basic_istreamstream<charT, traits, Allocator>& y);
```

*Effects:* Equivalent to: `x.swap(y)`.

## 31.8.3.4 Member functions

[istream.members]

```
basic_stringbuf<charT, traits, Allocator>* rdbuf() const;
```

*Returns:* `const_cast<basic_stringbuf<charT, traits, Allocator>*>(addressof(sb)).`

```
basic_string<charT, traits, Allocator> str() const &;
```

*Effects:* Equivalent to: `return rdbuf()->str();`

```
template<class SAlloc>
```

```
basic_string<charT, traits, SAlloc> str(const SAlloc& sa) const;
```

*Effects:* Equivalent to: `return rdbuf()->str(sa);`

```
basic_string<charT, traits, Allocator> str() &&;
```

*Effects:* Equivalent to: `return std::move(*rdbuf()).str();`

```
basic_string_view<charT, traits> view() const noexcept;
```

*Effects:* Equivalent to: `return rdbuf()->view();`

```
void str(const basic_string<charT, traits, Allocator>& s);
```

*Effects:* Equivalent to: `rdbuf()->str(s);`

```
template<class SAlloc>
```

```
void str(const basic_string<charT, traits, SAlloc>& s);
```

*Effects:* Equivalent to: `rdbuf()->str(s);`

```
void str(basic_string<charT, traits, Allocator>&& s);
```

*Effects:* Equivalent to: `rdbuf()->str(std::move(s));`

## 31.8.4 Class template basic\_ostringstream

[ostreamstream]

## 31.8.4.1 General

[ostreamstream.general]

```
namespace std {
```

```
template<class charT, class traits = char_traits<charT>,
```

```
class Allocator = allocator<charT>>
```

```
class basic_ostringstream : public basic_ostream<charT, traits> {
```

```
public:
```

```
using char_type
```

```
= charT;
```

```
using int_type
```

```
= typename traits::int_type;
```

```
using pos_type
```

```
= typename traits::pos_type;
```

```
using off_type
```

```
= typename traits::off_type;
```

```
using traits_type
```

```
= traits;
```

```
using allocator_type
```

```
= Allocator;
```

```
// 31.8.4.2, constructors
```

```
basic_ostringstream() : basic_ostringstream(ios_base::out) {}
```

```
explicit basic_ostringstream(ios_base::openmode which);
```

```
explicit basic_ostringstream(
```

```
const basic_string<charT, traits, Allocator>& s,
```

```
ios_base::openmode which = ios_base::out);
```

```
basic_ostringstream(ios_base::openmode which, const Allocator& a);
```

```
explicit basic_ostringstream(
```

```
basic_string<charT, traits, Allocator>&& s,
```

```
ios_base::openmode which = ios_base::out);
```

```
template<class SAlloc>
```

```
basic_ostringstream(
```

```
const basic_string<charT, traits, SAlloc>& s, const Allocator& a)
```

```
: basic_ostringstream(s, ios_base::out, a) {}
```

```
template<class SAlloc>
```

```
basic_ostringstream(
```

```
const basic_string<charT, traits, SAlloc>& s,
```

```
ios_base::openmode which, const Allocator& a);
```

```

template<class SAlloc>
    explicit basic_ostringstream(
        const basic_string<charT, traits, SAlloc>& s,
        ios_base::openmode which = ios_base::out);
basic_ostringstream(const basic_ostringstream&) = delete;
basic_ostringstream(basic_ostringstream&& rhs);

basic_ostringstream& operator=(const basic_ostringstream&) = delete;
basic_ostringstream& operator=(basic_ostringstream&& rhs);

// 31.8.4.3, swap
void swap(basic_ostringstream& rhs);

// 31.8.4.4, members
basic_stringbuf<charT, traits, Allocator>* rdbuf() const;

basic_string<charT, traits, Allocator> str() const &;
template<class SAlloc>
    basic_string<charT, traits, SAlloc> str(const SAlloc& sa) const;
basic_string<charT, traits, Allocator> str() &&;
basic_string_view<charT, traits> view() const noexcept;

void str(const basic_string<charT, traits, Allocator>& s);
template<class SAlloc>
    void str(const basic_string<charT, traits, SAlloc>& s);
void str(basic_string<charT, traits, Allocator>&& s);

private:
    basic_stringbuf<charT, traits, Allocator> sb; // exposition only
};
}

```

The class `basic_ostringstream<charT, traits, Allocator>` supports writing objects of class `basic_string<charT, traits, Allocator>`. It uses a `basic_stringbuf` object to control the associated storage. For the sake of exposition, the maintained data is presented here as:

— `sb`, the `stringbuf` object.

### 31.8.4.2 Constructors

[`ostreamstream.cons`]

```
explicit basic_ostringstream(ios_base::openmode which);
```

*Effects:* Initializes the base class with `basic_ostream<charT, traits>(addressof(sb))` (31.7.6.2) and `sb` with `basic_stringbuf<charT, traits, Allocator>(which | ios_base::out)` (31.8.2.2).

```
explicit basic_ostringstream(
    const basic_string<charT, traits, Allocator>& s,
    ios_base::openmode which = ios_base::out);
```

*Effects:* Initializes the base class with `basic_ostream<charT, traits>(addressof(sb))` (31.7.6.2) and `sb` with `basic_stringbuf<charT, traits, Allocator>(s, which | ios_base::out)` (31.8.2.2).

```
basic_ostringstream(ios_base::openmode which, const Allocator& a);
```

*Effects:* Initializes the base class with `basic_ostream<charT, traits>(addressof(sb))` (31.7.6.2) and `sb` with `basic_stringbuf<charT, traits, Allocator>(which | ios_base::out, a)` (31.8.2.2).

```
explicit basic_ostringstream(
    basic_string<charT, traits, Allocator>&& s,
    ios_base::openmode which = ios_base::out);
```

*Effects:* Initializes the base class with `basic_ostream<charT, traits>(addressof(sb))` (31.7.6.2) and `sb` with `basic_stringbuf<charT, traits, Allocator>(std::move(s), which | ios_base::out)` (31.8.2.2).

```
template<class SAlloc>
basic_ostringstream(
    const basic_string<charT, traits, SAlloc>& s,
    ios_base::openmode which, const Allocator& a);
```

*Effects:* Initializes the base class with `basic_ostream<charT, traits>(addressof(sb))` (31.7.6.2) and `sb` with `basic_stringbuf<charT, traits, Allocator>(s, which | ios_base::out, a)` (31.8.2.2).

```
template<class SAlloc>
explicit basic_ostringstream(
    const basic_string<charT, traits, SAlloc>& s,
    ios_base::openmode which = ios_base::out);
```

*Constraints:* `is_same_v<SAlloc, Allocator>` is false.

*Effects:* Initializes the base class with `basic_ostream<charT, traits>(addressof(sb))` (31.7.6.2) and `sb` with `basic_stringbuf<charT, traits, Allocator>(s, which | ios_base::out)` (31.8.2.2).

```
basic_ostringstream(basic_ostringstream&& rhs);
```

*Effects:* Move constructs from the rvalue `rhs`. This is accomplished by move constructing the base class, and the contained `basic_stringbuf`. Then calls `basic_ostream<charT, traits>::set_rdbuf(addressof(sb))` to install the contained `basic_stringbuf`.

### 31.8.4.3 Swap

[ostreamstream.swap]

```
void swap(basic_ostringstream& rhs);
```

*Effects:* Equivalent to:

```
    basic_ostream<charT, traits>::swap(rhs);
    sb.swap(rhs.sb);
```

```
template<class charT, class traits, class Allocator>
void swap(basic_ostringstream<charT, traits, Allocator>& x,
         basic_ostringstream<charT, traits, Allocator>& y);
```

*Effects:* Equivalent to: `x.swap(y)`.

### 31.8.4.4 Member functions

[ostreamstream.members]

```
basic_stringbuf<charT, traits, Allocator>* rdbuf() const;
```

*Returns:* `const_cast<basic_stringbuf<charT, traits, Allocator>*>(addressof(sb))`.

```
basic_string<charT, traits, Allocator> str() const &;
```

*Effects:* Equivalent to: `return rdbuf()->str()`;

```
template<class SAlloc>
basic_string<charT, traits, SAlloc> str(const SAlloc& sa) const;
```

*Effects:* Equivalent to: `return rdbuf()->str(sa)`;

```
basic_string<charT, traits, Allocator> str() &&;
```

*Effects:* Equivalent to: `return std::move(*rdbuf()).str()`;

```
basic_string_view<charT, traits> view() const noexcept;
```

*Effects:* Equivalent to: `return rdbuf()->view()`;

```
void str(const basic_string<charT, traits, Allocator>& s);
```

*Effects:* Equivalent to: `rdbuf()->str(s)`;

```
template<class SAlloc>
void str(const basic_string<charT, traits, SAlloc>& s);
```

*Effects:* Equivalent to: `rdbuf()->str(s)`;

```
void str(basic_string<charT, traits, Allocator>&& s);
```

*Effects:* Equivalent to: `rdbuf()->str(std::move(s));`

### 31.8.5 Class template `basic_stringstream`

[stringstream]

#### 31.8.5.1 General

[stringstream.general]

```
namespace std {
    template<class charT, class traits = char_traits<charT>,
             class Allocator = allocator<charT>>
    class basic_stringstream : public basic_istream<charT, traits> {
    public:
        using char_type      = charT;
        using int_type        = typename traits::int_type;
        using pos_type        = typename traits::pos_type;
        using off_type        = typename traits::off_type;
        using traits_type     = traits;
        using allocator_type  = Allocator;

        // 31.8.5.2, constructors
        basic_stringstream() : basic_stringstream(ios_base::out | ios_base::in) {}
        explicit basic_stringstream(ios_base::openmode which);
        explicit basic_stringstream(
            const basic_string<charT, traits, Allocator>& s,
            ios_base::openmode which = ios_base::out | ios_base::in);
        basic_stringstream(ios_base::openmode which, const Allocator& a);
        explicit basic_stringstream(
            basic_string<charT, traits, Allocator>&& s,
            ios_base::openmode which = ios_base::out | ios_base::in);
        template<class SAlloc>
        basic_stringstream(
            const basic_string<charT, traits, SAlloc>& s, const Allocator& a)
            : basic_stringstream(s, ios_base::out | ios_base::in, a) {}
        template<class SAlloc>
        basic_stringstream(
            const basic_string<charT, traits, SAlloc>& s,
            ios_base::openmode which, const Allocator& a);
        template<class SAlloc>
        explicit basic_stringstream(
            const basic_string<charT, traits, SAlloc>& s,
            ios_base::openmode which = ios_base::out | ios_base::in);
        basic_stringstream(const basic_stringstream&) = delete;
        basic_stringstream(basic_stringstream&& rhs);

        basic_stringstream& operator=(const basic_stringstream&) = delete;
        basic_stringstream& operator=(basic_stringstream&& rhs);

        // 31.8.5.3, swap
        void swap(basic_stringstream& rhs);

        // 31.8.5.4, members
        basic_stringbuf<charT, traits, Allocator>* rdbuf() const;

        basic_string<charT, traits, Allocator> str() const &;
        template<class SAlloc>
        basic_string<charT, traits, SAlloc> str(const SAlloc& sa) const;
        basic_string<charT, traits, Allocator> str() &&;
        basic_string_view<charT, traits> view() const noexcept;

        void str(const basic_string<charT, traits, Allocator>& s);
        template<class SAlloc>
        void str(const basic_string<charT, traits, SAlloc>& s);
        void str(basic_string<charT, traits, Allocator>&& s);
```

```
private:
    basic_stringbuf<charT, traits, Allocator> sb;    // exposition only
};
}
```

The class template `basic_stringstream<charT, traits>` supports reading and writing from objects of class `basic_string<charT, traits, Allocator>`. It uses a `basic_stringbuf<charT, traits, Allocator>` object to control the associated sequence. For the sake of exposition, the maintained data is presented here as

— `sb`, the `stringbuf` object.

### 31.8.5.2 Constructors

[`stringstream.cons`]

```
explicit basic_stringstream(ios_base::openmode which);
```

*Effects:* Initializes the base class with `basic_istream<charT, traits>(addressof(sb))` (31.7.5.7.2) and `sb` with `basic_stringbuf<charT, traits, Allocator>(which)`.

```
explicit basic_stringstream(
    const basic_string<charT, traits, Allocator>& s,
    ios_base::openmode which = ios_base::out | ios_base::in);
```

*Effects:* Initializes the base class with `basic_istream<charT, traits>(addressof(sb))` (31.7.5.7.2) and `sb` with `basic_stringbuf<charT, traits, Allocator>(s, which)`.

```
basic_stringstream(ios_base::openmode which, const Allocator& a);
```

*Effects:* Initializes the base class with `basic_istream<charT, traits>(addressof(sb))` (31.7.5.7.2) and `sb` with `basic_stringbuf<charT, traits, Allocator>(which, a)` (31.8.2.2).

```
explicit basic_stringstream(
    basic_string<charT, traits, Allocator>&& s,
    ios_base::openmode which = ios_base::out | ios_base::in);
```

*Effects:* Initializes the base class with `basic_istream<charT, traits>(addressof(sb))` (31.7.5.7.2) and `sb` with `basic_stringbuf<charT, traits, Allocator>(std::move(s), which)` (31.8.2.2).

```
template<class SAlloc>
basic_stringstream(
    const basic_string<charT, traits, SAlloc>& s,
    ios_base::openmode which, const Allocator& a);
```

*Effects:* Initializes the base class with `basic_istream<charT, traits>(addressof(sb))` (31.7.5.7.2) and `sb` with `basic_stringbuf<charT, traits, Allocator>(s, which, a)` (31.8.2.2).

```
template<class SAlloc>
explicit basic_stringstream(
    const basic_string<charT, traits, SAlloc>& s,
    ios_base::openmode which = ios_base::out | ios_base::in);
```

*Constraints:* `is_same_v<SAlloc, Allocator>` is false.

*Effects:* Initializes the base class with `basic_istream<charT, traits>(addressof(sb))` (31.7.5.7.2) and `sb` with `basic_stringbuf<charT, traits, Allocator>(s, which)` (31.8.2.2).

```
basic_stringstream(basic_stringstream&& rhs);
```

*Effects:* Move constructs from the rvalue `rhs`. This is accomplished by move constructing the base class, and the contained `basic_stringbuf`. Then calls `basic_istream<charT, traits>::set_rdbuf(addressof(sb))` to install the contained `basic_stringbuf`.

### 31.8.5.3 Swap

[`stringstream.swap`]

```
void swap(basic_stringstream& rhs);
```

*Effects:* Equivalent to:

```
basic_istream<charT, traits>::swap(rhs);
sb.swap(rhs.sb);
```

```
template<class charT, class traits, class Allocator>
void swap(basic_stringstream<charT, traits, Allocator>& x,
         basic_stringstream<charT, traits, Allocator>& y);
```

*Effects:* Equivalent to: `x.swap(y)`.

#### 31.8.5.4 Member functions

[[stringstream.members](#)]

```
basic_stringbuf<charT, traits, Allocator>* rdbuf() const;
```

*Returns:* `const_cast<basic_stringbuf<charT, traits, Allocator>*>(addressof(sb))`.

```
basic_string<charT, traits, Allocator> str() const &;
```

*Effects:* Equivalent to: `return rdbuf()->str()`;

```
template<class SAlloc>
```

```
basic_string<charT, traits, SAlloc> str(const SAlloc& sa) const;
```

*Effects:* Equivalent to: `return rdbuf()->str(sa)`;

```
basic_string<charT, traits, Allocator> str() &&;
```

*Effects:* Equivalent to: `return std::move(*rdbuf()).str()`;

```
basic_string_view<charT, traits> view() const noexcept;
```

*Effects:* Equivalent to: `return rdbuf()->view()`;

```
void str(const basic_string<charT, traits, Allocator>& s);
```

*Effects:* Equivalent to: `rdbuf()->str(s)`;

```
template<class SAlloc>
```

```
void str(const basic_string<charT, traits, SAlloc>& s);
```

*Effects:* Equivalent to: `rdbuf()->str(s)`;

```
void str(basic_string<charT, traits, Allocator>&& s);
```

*Effects:* Equivalent to: `rdbuf()->str(std::move(s))`;

### 31.9 Span-based streams

[[span.streams](#)]

#### 31.9.1 Overview

[[span.streams.overview](#)]

The header `<spanstream>` defines class templates and types that associate stream buffers with objects whose types are specializations of `span`, as described in [24.7.2.2](#).

NOTE A user of these classes is responsible for ensuring that the character sequence represented by the given `span` outlives the use of the sequence by objects of the classes in [31.9](#). Using multiple `basic_spanbuf` objects referring to overlapping underlying sequences from different threads, where at least one `basic_spanbuf` object is used for writing to the sequence, results in a data race.

#### 31.9.2 Header `<spanstream>` synopsis

[[spanstream.syn](#)]

```
namespace std {
    template<class charT, class traits = char_traits<charT>>
        class basic_spanbuf;

    template<class charT, class traits>
        void swap(basic_spanbuf<charT, traits>& x, basic_spanbuf<charT, traits>& y);

    using spanbuf = basic_spanbuf<char>;
    using wspanbuf = basic_spanbuf<wchar_t>;

    template<class charT, class traits = char_traits<charT>>
        class basic_ispanstream;

    template<class charT, class traits>
        void swap(basic_ispanstream<charT, traits>& x, basic_ispanstream<charT, traits>& y);
```

```

using ispanstream = basic_ispanstream<char>;
using wspanstream = basic_ispanstream<wchar_t>;

template<class charT, class traits = char_traits<charT>>
    class basic_ostream;

template<class charT, class traits>
    void swap(basic_ostream<charT, traits>& x, basic_ostream<charT, traits>& y);

using ostream = basic_ostream<char>;
using wostream = basic_ostream<wchar_t>;

template<class charT, class traits = char_traits<charT>>
    class basic_spanstream;

template<class charT, class traits>
    void swap(basic_spanstream<charT, traits>& x, basic_spanstream<charT, traits>& y);

using spanstream = basic_spanstream<char>;
using wspanstream = basic_spanstream<wchar_t>;
}

```

### 31.9.3 Class template basic\_spanbuf

[spanbuf]

#### 31.9.3.1 General

[spanbuf.general]

```

namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_spanbuf
    : public basic_streambuf<charT, traits> {
    public:
        using char_type = charT;
        using int_type = typename traits::int_type;
        using pos_type = typename traits::pos_type;
        using off_type = typename traits::off_type;
        using traits_type = traits;

        // 31.9.3.2, constructors
        basic_spanbuf() : basic_spanbuf(ios_base::in | ios_base::out) {}
        explicit basic_spanbuf(ios_base::openmode which)
            : basic_spanbuf(std::span<charT>(), which) {}
        explicit basic_spanbuf(std::span<charT> s,
                               ios_base::openmode which = ios_base::in | ios_base::out);
        basic_spanbuf(const basic_spanbuf&) = delete;
        basic_spanbuf(basic_spanbuf&& rhs);

        // 31.9.3.3, assignment and swap
        basic_spanbuf& operator=(const basic_spanbuf&) = delete;
        basic_spanbuf& operator=(basic_spanbuf&& rhs);
        void swap(basic_spanbuf& rhs);

        // 31.9.3.4, member functions
        std::span<charT> span() const noexcept;
        void span(std::span<charT> s) noexcept;

    protected:
        // 31.9.3.5, overridden virtual functions
        basic_streambuf<charT, traits>* setbuf(charT*, streamsize) override;
        pos_type seekoff(off_type off, ios_base::seekdir way,
                        ios_base::openmode which = ios_base::in | ios_base::out) override;
        pos_type seekpos(pos_type sp,
                        ios_base::openmode which = ios_base::in | ios_base::out) override;

    private:
        ios_base::openmode mode; // exposition only
    };
}

```

```

    std::span<charT> buf;                // exposition only
};
}

```

The class template `basic_spanbuf` is derived from `basic_streambuf` to associate possibly the input sequence and possibly the output sequence with a sequence of arbitrary characters. The sequence is provided by an object of class `span<charT>`.

For the sake of exposition, the maintained data is presented here as:

- `ios_base::openmode mode`, has in set if the input sequence can be read, and out set if the output sequence can be written.
- `std::span<charT> buf` is the view to the underlying character sequence.

### 31.9.3.2 Constructors [spanbuf.cons]

```

explicit basic_spanbuf(std::span<charT> s,
                      ios_base::openmode which = ios_base::in | ios_base::out);

```

*Effects:* Initializes the base class with `basic_streambuf()` (31.6.3.2), and `mode` with `which`. Initializes the internal pointers as if calling `span(s)`.

```

basic_spanbuf(basic_spanbuf&& rhs);

```

*Effects:* Initializes the base class with `std::move(rhs)` and `mode` with `std::move(rhs.mode)` and `buf` with `std::move(rhs.buf)`. The sequence pointers in `*this` (`eback()`, `gptr()`, `egptr()`, `pbase()`, `pptr()`, `epptr()`) obtain the values which `rhs` had. It is implementation-defined whether `rhs.buf.empty()` returns `true` after the move.

*Postconditions:* Let `rhs_p` refer to the state of `rhs` just prior to this construction.

- `span().data() == rhs_p.span().data()`
- `span().size() == rhs_p.span().size()`
- `eback() == rhs_p.eback()`
- `gptr() == rhs_p.gptr()`
- `egptr() == rhs_p.egptr()`
- `pbase() == rhs_p.pbase()`
- `pptr() == rhs_p.pptr()`
- `epptr() == rhs_p.epptr()`
- `getloc() == rhs_p.getloc()`

### 31.9.3.3 Assignment and swap [spanbuf.assign]

```

basic_spanbuf& operator=(basic_spanbuf&& rhs);

```

*Effects:* Equivalent to:

```

    basic_spanbuf tmp{std::move(rhs)};
    this->swap(tmp);
    return *this;

```

```

void swap(basic_spanbuf& rhs);

```

*Effects:* Equivalent to:

```

    basic_streambuf<charT, traits>::swap(rhs);
    std::swap(mode, rhs.mode);
    std::swap(buf, rhs.buf);

```

```

template<class charT, class traits>

```

```

    void swap(basic_spanbuf<charT, traits>& x, basic_spanbuf<charT, traits>& y);

```

*Effects:* Equivalent to `x.swap(y)`.

### 31.9.3.4 Member functions [spanbuf.members]

```
std::span<charT> span() const noexcept;
```

*Returns:* If `ios_base::out` is set in *mode*, returns `std::span<charT>(pbase(), pptr())`, otherwise returns *buf*.

NOTE In contrast to `basic_stringbuf`, the underlying sequence never grows and is not owned. An owning copy can be obtained by converting the result to `basic_string<charT>`.

```
void span(std::span<charT> s) noexcept;
```

*Effects:* *buf* = *s*. Initializes the input and output sequences according to *mode*.

*Postconditions:*

- If `ios_base::out` is set in *mode*, `pbase() == s.data() && epptr() == pbase() + s.size()` is true;
  - in addition, if `ios_base::ate` is set in *mode*, `pptr() == pbase() + s.size()` is true,
  - otherwise `pptr() == pbase()` is true.
- If `ios_base::in` is set in *mode*, `eback() == s.data() && gptra() == eback() && egptra() == eback() + s.size()` is true.

### 31.9.3.5 Overridden virtual functions

[`spanbuf.virtuals`]

NOTE Because the underlying buffer is of fixed size, neither `overflow`, `underflow`, nor `packfail` can provide useful behavior.

```
pos_type seekoff(off_type off, ios_base::seekdir way,
                ios_base::openmode which = ios_base::in | ios_base::out) override;
```

*Effects:* Alters the stream position within one or both of the controlled sequences, if possible, as follows:

- If `ios_base::in` is set in *which*, positions the input sequence; *xnext* is `gptra()`, *xbeg* is `eback()`.
- If `ios_base::out` is set in *which*, positions the output sequence; *xnext* is `pptra()`, *xbeg* is `pbase()`.

If both `ios_base::in` and `ios_base::out` are set in *which* and *way* is `ios_base::cur`, the positioning operation fails.

For a sequence to be positioned, if its next pointer *xnext* (either `gptra()` or `pptra()`) is a null pointer and the new offset *newoff* as computed below is nonzero, the positioning operation fails. Otherwise, the function determines *baseoff* as a value of type *off\_type* as follows:

- 0 when *way* is `ios_base::beg`;
- `(pptra() - pbase())` for the output sequence, or `(gptra() - eback())` for the input sequence when *way* is `ios_base::cur`;
- when *way* is `ios_base::end`:
  - `(pptra() - pbase())` if `ios_base::out` is set in *mode* and `ios_base::in` is not set in *mode*,
  - `buf.size()` otherwise.

If *baseoff* + *off* would overflow, or if *baseoff* + *off* is less than zero, or if *baseoff* + *off* is greater than `buf.size()`, the positioning operation fails. Otherwise, the function computes

```
off_type newoff = baseoff + off;
```

and assigns `xbeg + newoff` to the next pointer *xnext*.

*Returns:* `pos_type(off_type(-1))` if the positioning operation fails; `pos_type(newoff)` otherwise.

```
pos_type seekpos(pos_type sp, ios_base::openmode which = ios_base::in | ios_base::out) override;
```

*Effects:* Equivalent to:

```
return seekoff(off_type(sp), ios_base::beg, which);
```

```
basic_streambuf<charT, traits>* setbuf(charT* s, streamsize n) override;
```

*Effects:* Equivalent to:

```
this->span(std::span<charT>(s, n));
return this;
```

**31.9.4 Class template basic\_ispanstream****[ispanstream]****31.9.4.1 General****[ispanstream.general]**

```

namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_ispanstream
        : public basic_istream<charT, traits> {
    public:
        using char_type      = charT;
        using int_type        = typename traits::int_type;
        using pos_type        = typename traits::pos_type;
        using off_type        = typename traits::off_type;
        using traits_type     = traits;

        // 31.9.4.2, constructors
        explicit basic_ispanstream(std::span<charT> s,
                                   ios_base::openmode which = ios_base::in);
        basic_ispanstream(const basic_ispanstream&) = delete;
        basic_ispanstream(basic_ispanstream&& rhs);
        template<class ROS> explicit basic_ispanstream(ROS&& s);

        basic_ispanstream& operator=(const basic_ispanstream&) = delete;
        basic_ispanstream& operator=(basic_ispanstream&& rhs);

        // 31.9.4.3, swap
        void swap(basic_ispanstream& rhs);

        // 31.9.4.4, member functions
        basic_spanbuf<charT, traits>* rdbuf() const noexcept;

        std::span<const charT> span() const noexcept;
        void span(std::span<charT> s) noexcept;
        template<class ROS> void span(ROS&& s) noexcept;

    private:
        basic_spanbuf<charT, traits> sb; // exposition only
    };
}

```

NOTE Constructing an `ispanstream` from a *string-literal* includes the termination character `'\0'` in the underlying `spanbuf`.

**31.9.4.2 Constructors****[ispanstream.cons]**

```
explicit basic_ispanstream(std::span<charT> s, ios_base::openmode which = ios_base::in);
```

*Effects:* Initializes the base class with `basic_istream<charT, traits>(addressof(sb))` and `sb` with `basic_spanbuf<charT, traits>(s, which | ios_base::in)` (31.9.3.2).

```
basic_ispanstream(basic_ispanstream&& rhs);
```

*Effects:* Initializes the base class with `std::move(rhs)` and `sb` with `std::move(rhs.sb)`. Next, `basic_istream<charT, traits>::set_rdbuf(addressof(sb))` is called to install the contained `basic_spanbuf`.

```
template<class ROS> explicit basic_ispanstream(ROS&& s)
```

*Constraints:* `ROS` models `ranges::borrowed_range`. `!convertible_to<ROS, std::span<charT>>> && convertible_to<ROS, std::span<charT const>>` is true.

*Effects:* Let `sp` be `std::span<const charT>(std::forward<ROS>(s))`. Equivalent to

```
basic_ispanstream(std::span<charT>(const_cast<charT*>(sp.data()), sp.size()))
```

**31.9.4.3 Swap****[ispanstream.swap]**

```
void swap(basic_ispanstream& rhs);
```

*Effects:* Equivalent to:

```
basic_istream<charT, traits>::swap(rhs);
sb.swap(rhs.sb);
```

```
template<class charT, class traits>
```

```
void swap(basic_ispanstream<charT, traits>& x, basic_ispanstream<charT, traits>& y);
```

*Effects:* Equivalent to `x.swap(y)`.

#### 31.9.4.4 Member functions

[ispanstream.members]

```
basic_spanbuf<charT, traits>* rdbuf() const noexcept;
```

*Effects:* Equivalent to:

```
return const_cast<basic_spanbuf<charT, traits>*>(addressof(sb));
```

```
std::span<const charT> span() const noexcept;
```

*Effects:* Equivalent to: `return rdbuf()->span();`

```
void span(std::span<charT> s) noexcept;
```

*Effects:* Equivalent to `rdbuf()->span(s)`.

```
template<class ROS> void span(ROS&& s) noexcept;
```

*Constraints:* ROS models `ranges::borrowed_range`. (!`convertible_to<ROS, std::span<charT>>`)  
&& `convertible_to<ROS, std::span<const charT>>` is true

*Effects:* Let `sp` be `std::span<const charT>(std::forward<ROS>(s))`. Equivalent to:

```
this->span(std::span<charT>(const_cast<charT*>(sp.data()), sp.size()))
```

### 31.9.5 Class template `basic_ostream`

[ostream]

#### 31.9.5.1 General

[ostream.general]

```
namespace std {
```

```
template<class charT, class traits = char_traits<charT>>
```

```
class basic_ostream
```

```
: public basic_ostream<charT, traits> {
```

```
public:
```

```
using char_type = charT;
```

```
using int_type = typename traits::int_type;
```

```
using pos_type = typename traits::pos_type;
```

```
using off_type = typename traits::off_type;
```

```
using traits_type = traits;
```

```
// 31.9.5.2, constructors
```

```
explicit basic_ostream(std::span<charT> s,
```

```
ios_base::openmode which = ios_base::out);
```

```
basic_ostream(const basic_ostream&) = delete;
```

```
basic_ostream(basic_ostream&& rhs);
```

```
basic_ostream& operator=(const basic_ostream&) = delete;
```

```
basic_ostream& operator=(basic_ostream&& rhs);
```

```
// 31.9.5.3, swap
```

```
void swap(basic_ostream& rhs);
```

```
// 31.9.5.4, member functions
```

```
basic_spanbuf<charT, traits>* rdbuf() const noexcept;
```

```
std::span<charT> span() const noexcept;
```

```
void span(std::span<charT> s) noexcept;
```

```
private:
    basic_spanbuf<charT, traits> sb;    // exposition only
};
}
```

### 31.9.5.2 Constructors

[ospanstream.cons]

```
explicit basic_ospanstream(std::span<charT> s,
                           ios_base::openmode which = ios_base::out);
```

*Effects:* Initializes the base class with `basic_ostream<charT, traits>(addressof(sb))` and `sb` with `basic_spanbuf<charT, traits>(s, which | ios_base::out)` (31.9.3.2).

```
basic_ospanstream(basic_ospanstream&& rhs) noexcept;
```

*Effects:* Initializes the base class with `std::move(rhs)` and `sb` with `std::move(rhs.sb)`. Next, `basic_ostream<charT, traits>::set_rdbuf(addressof(sb))` is called to install the contained `basic_spanbuf`.

### 31.9.5.3 Swap

[ospanstream.swap]

```
void swap(basic_ospanstream& rhs);
```

*Effects:* Equivalent to:

```
    basic_ostream<charT, traits>::swap(rhs);
    sb.swap(rhs.sb);
```

```
template<class charT, class traits>
```

```
void swap(basic_ospanstream<charT, traits>& x, basic_ospanstream<charT, traits>& y);
```

*Effects:* Equivalent to `x.swap(y)`.

### 31.9.5.4 Member functions

[ospanstream.members]

```
basic_spanbuf<charT, traits>* rdbuf() const noexcept;
```

*Effects:* Equivalent to:

```
    return const_cast<basic_spanbuf<charT, traits>*>(addressof(sb));
```

```
std::span<charT> span() const noexcept;
```

*Effects:* Equivalent to: `return rdbuf()->span();`

```
void span(std::span<charT> s) noexcept;
```

*Effects:* Equivalent to `rdbuf()->span(s)`.

## 31.9.6 Class template `basic_spanstream`

[spanstream]

### 31.9.6.1 General

[spanstream.general]

```
namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_spanstream
    : public basic_istream<charT, traits> {
    public:
        using char_type      = charT;
        using int_type        = typename traits::int_type;
        using pos_type        = typename traits::pos_type;
        using off_type        = typename traits::off_type;
        using traits_type     = traits;

        // 31.9.6.2, constructors
        explicit basic_spanstream(std::span<charT> s,
                                  ios_base::openmode which = ios_base::out | ios_base::in);

        basic_spanstream(const basic_spanstream&) = delete;
        basic_spanstream(basic_spanstream&& rhs);

        basic_spanstream& operator=(const basic_spanstream&) = delete;
        basic_spanstream& operator=(basic_spanstream&& rhs);
```

```

// 31.9.6.3, swap
void swap(basic_spanstream& rhs);

// 31.9.6.4, members
basic_spanbuf<charT, traits>* rdbuf() const noexcept;

std::span<charT> span() const noexcept;
void span(std::span<charT> s) noexcept;

private:
    basic_spanbuf<charT, traits> sb;    // exposition only
};
}

```

### 31.9.6.2 Constructors [spanstream.cons]

```
explicit basic_spanstream(std::span<charT> s,
                          ios_base::openmode which = ios_base::out | ios_base::in);
```

*Effects:* Initializes the base class with `basic_iostream<charT, traits>(addressof(sb))` and `sb` with `basic_spanbuf<charT, traits>(s, which)` (31.9.3.2).

```
basic_spanstream(basic_spanstream&& rhs);
```

*Effects:* Initializes the base class with `std::move(rhs)` and `sb` with `std::move(rhs.sb)`. Next, `basic_iostream<charT, traits>::set_rdbuf(addressof(sb))` is called to install the contained `basic_spanbuf`.

### 31.9.6.3 Swap [spanstream.swap]

```
void swap(basic_spanstream& rhs);
```

*Effects:* Equivalent to:

```
    basic_iostream<charT, traits>::swap(rhs);
    sb.swap(rhs.sb);
```

```
template<class charT, class traits>
void swap(basic_spanstream<charT, traits>& x, basic_spanstream<charT, traits>& y);
```

*Effects:* Equivalent to `x.swap(y)`.

### 31.9.6.4 Member functions [spanstream.members]

```
basic_spanbuf<charT, traits>* rdbuf() const noexcept;
```

*Effects:* Equivalent to:

```
    return const_cast<basic_spanbuf<charT, traits>*>(addressof(sb));
```

```
std::span<charT> span() const noexcept;
```

*Effects:* Equivalent to: `return rdbuf()->span();`

```
void span(std::span<charT> s) noexcept;
```

*Effects:* Equivalent to `rdbuf()->span(s)`.

## 31.10 File-based streams [file.streams]

### 31.10.1 Header <fstream> synopsis [fstream.syn]

```
namespace std {
    template<class charT, class traits = char_traits<charT>>
        class basic_filebuf;

    template<class charT, class traits>
        void swap(basic_filebuf<charT, traits>& x, basic_filebuf<charT, traits>& y);

    using filebuf = basic_filebuf<char>;
    using wfilebuf = basic_filebuf<wchar_t>;
}

```

```

template<class charT, class traits = char_traits<charT>>
    class basic_ifstream;

template<class charT, class traits>
    void swap(basic_ifstream<charT, traits>& x, basic_ifstream<charT, traits>& y);

using ifstream = basic_ifstream<char>;
using wifstream = basic_ifstream<wchar_t>;

template<class charT, class traits = char_traits<charT>>
    class basic_ofstream;

template<class charT, class traits>
    void swap(basic_ofstream<charT, traits>& x, basic_ofstream<charT, traits>& y);

using ofstream = basic_ofstream<char>;
using wofstream = basic_ofstream<wchar_t>;

template<class charT, class traits = char_traits<charT>>
    class basic_fstream;

template<class charT, class traits>
    void swap(basic_fstream<charT, traits>& x, basic_fstream<charT, traits>& y);

using fstream = basic_fstream<char>;
using wfstream = basic_fstream<wchar_t>;
}

```

The header `<fstream>` defines four class templates and eight types that associate stream buffers with files and assist reading and writing files.

NOTE 1 The class template `basic_filebuf` treats a file as a source or sink of bytes. In an environment that uses a large character set, the file typically holds multibyte character sequences and the `basic_filebuf` object converts those multibyte sequences into wide character sequences.

In subclause 31.10, member functions taking arguments of `const filesystem::path::value_type*` are only provided on systems where `filesystem::path::value_type` (31.12.6) is not `char`.

NOTE 2 These functions enable class `path` support for systems with a wide native path character type, such as `wchar_t`.

### 31.10.2 Class template `basic_filebuf`

[filebuf]

#### 31.10.2.1 General

[filebuf.general]

```

namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_filebuf : public basic_streambuf<charT, traits> {
    public:
        using char_type = charT;
        using int_type = typename traits::int_type;
        using pos_type = typename traits::pos_type;
        using off_type = typename traits::off_type;
        using traits_type = traits;

        // 31.10.2.2, constructors/destructor
        basic_filebuf();
        basic_filebuf(const basic_filebuf&) = delete;
        basic_filebuf(basic_filebuf&& rhs);
        virtual ~basic_filebuf();

        // 31.10.2.3, assignment and swap
        basic_filebuf& operator=(const basic_filebuf&) = delete;
        basic_filebuf& operator=(basic_filebuf&& rhs);
        void swap(basic_filebuf& rhs);
    };
}

```

```

// 31.10.2.4, members
bool is_open() const;
basic_filebuf* open(const char* s, ios_base::openmode mode);
basic_filebuf* open(const filesystem::path::value_type* s,
                    ios_base::openmode mode); // wide systems only; see 31.10.1
basic_filebuf* open(const string& s,
                    ios_base::openmode mode);
basic_filebuf* open(const filesystem::path& s,
                    ios_base::openmode mode);
basic_filebuf* close();

protected:
// 31.10.2.5, overridden virtual functions
streamsize showmanyc() override;
int_type underflow() override;
int_type uflow() override;
int_type pbackfail(int_type c = traits::eof()) override;
int_type overflow (int_type c = traits::eof()) override;

basic_streambuf<charT, traits>* setbuf(char_type* s,
                                     streamsize n) override;
pos_type seekoff(off_type off, ios_base::seekdir way,
                 ios_base::openmode which
                 = ios_base::in | ios_base::out) override;
pos_type seekpos(pos_type sp,
                 ios_base::openmode which
                 = ios_base::in | ios_base::out) override;
int      sync() override;
void     imbue(const locale& loc) override;
};
}

```

The class `basic_filebuf<charT, traits>` associates both the input sequence and the output sequence with a file.

The restrictions on reading and writing a sequence controlled by an object of class `basic_filebuf<charT, traits>` are the same as for reading and writing with the C standard library `FILES`.

In particular:

- If the file is not open for reading the input sequence cannot be read.
- If the file is not open for writing the output sequence cannot be written.
- A joint file position is maintained for both the input sequence and the output sequence.

An instance of `basic_filebuf` behaves as described in 31.10.2 provided `traits::pos_type` is `fpos<traits::state_type>`. Otherwise the behavior is undefined.

In order to support file I/O and multibyte/wide character conversion, conversions are performed using members of a facet, referred to as `a_codecvt` in following subclauses, obtained as if by

```

const codecvt<charT, char, typename traits::state_type>& a_codecvt =
    use_facet<codecvt<charT, char, typename traits::state_type>>(getloc());

```

### 31.10.2.2 Constructors

[filebuf.cons]

```
basic_filebuf();
```

*Effects:* Initializes the base class with `basic_streambuf<charT, traits>()` (31.6.3.2).

*Postconditions:* `is_open() == false`.

```
basic_filebuf(basic_filebuf&& rhs);
```

*Effects:* It is implementation-defined whether the sequence pointers in `*this` (`eback()`, `gptr()`, `egptr()`, `pbase()`, `pptr()`, `epptr()`) obtain the values which `rhs` had. Whether they do or not, `*this` and `rhs` reference separate buffers (if any at all) after the construction. Additionally `*this` references the file which `rhs` did before the construction, and `rhs` references no file after the construction. The openmode, locale and any other state of `rhs` is also copied.

*Postconditions:* Let `rhs_p` refer to the state of `rhs` just prior to this construction and let `rhs_a` refer to the state of `rhs` just after this construction.

```

— is_open() == rhs_p.is_open()
— rhs_a.is_open() == false
— gptr() - eback() == rhs_p.gptr() - rhs_p.eback()
— egptr() - eback() == rhs_p.egptr() - rhs_p.eback()
— pptr() - pbase() == rhs_p.pptr() - rhs_p.pbase()
— epptr() - pbase() == rhs_p.epptr() - rhs_p.pbase()
— if (eback()) eback() != rhs_a.eback()
— if (gptr()) gptr() != rhs_a.gptr()
— if (egptr()) egptr() != rhs_a.egptr()
— if (pbase()) pbase() != rhs_a.pbase()
— if (pptr()) pptr() != rhs_a.pptr()
— if (epptr()) epptr() != rhs_a.epptr()

```

```
virtual ~basic_filebuf();
```

*Effects:* Calls `close()`. If an exception occurs during the destruction of the object, including the call to `close()`, the exception is caught but not rethrown (see 16.4.6.13).

### 31.10.2.3 Assignment and swap

[filebuf.assign]

```
basic_filebuf& operator=(basic_filebuf&& rhs);
```

*Effects:* Calls `close()` then move assigns from `rhs`. After the move assignment `*this` has the observable state it would have had if it had been move constructed from `rhs` (see 31.10.2.2).

*Returns:* `*this`.

```
void swap(basic_filebuf& rhs);
```

*Effects:* Exchanges the state of `*this` and `rhs`.

```

template<class charT, class traits>
void swap(basic_filebuf<charT, traits>& x, basic_filebuf<charT, traits>& y);

```

*Effects:* Equivalent to: `x.swap(y)`.

### 31.10.2.4 Member functions

[filebuf.members]

```
bool is_open() const;
```

*Returns:* `true` if a previous call to `open` succeeded (returned a non-null value) and there has been no intervening call to `close`.

```

basic_filebuf* open(const char* s, ios_base::openmode mode);
basic_filebuf* open(const filesystem::path::value_type* s,
    ios_base::openmode mode); // wide systems only; see 31.10.1

```

*Preconditions:* `s` points to a NTCTS (3.34).

*Effects:* If `is_open() != false`, returns a null pointer. Otherwise, initializes the `filebuf` as required. It then opens the file to which `s` resolves, if possible, as if by a call to `fopen` with the second argument determined from `mode` & `~ios_base::ate` as indicated in Table 128. If `mode` is not some combination of flags shown in the table then the open fails.

If the open operation succeeds and `ios_base::ate` is set in `mode`, positions the file to the end (as if by calling `fseek(file, 0, SEEK_END)`, where `file` is the pointer returned by calling `fopen`).<sup>302</sup>

If the repositioning operation fails, calls `close()` and returns a null pointer to indicate failure.

*Returns:* `this` if successful, a null pointer otherwise.

<sup>302</sup> The macro `SEEK_END` is defined, and the function signatures `fopen(const char*, const char*)` and `fseek(FILE*, long, int)` are declared, in `<stdio>` (31.13.1).

Table 128 — File open modes [tab:filebuf.open.modes]

| binary | ios_base flag combination |     |       |     |           | stdio equivalent |
|--------|---------------------------|-----|-------|-----|-----------|------------------|
|        | in                        | out | trunc | app | noreplace |                  |

| +      | +                         | +   | +     |     |           | "w+b"            |
| +      | +                         | +   | +     |     | +         | "w+bx"           |
| +      | +                         | +   |       | +   |           | "a+b"            |
| +      | +                         |     |       | +   |           | "a+b"            |

```
basic_filebuf* open(const string& s, ios_base::openmode mode);
basic_filebuf* open(const filesystem::path& s, ios_base::openmode mode);
```

*Returns:* `open(s.c_str(), mode)`;

```
basic_filebuf* close();
```

*Effects:* If `is_open() == false`, returns a null pointer. If a put area exists, calls `overflow(trait::eof())` to flush characters. If the last virtual member function called on `*this` (between `underflow`, `overflow`, `seekoff`, and `seekpos`) was `overflow` then calls `a_codecvt.unshift` (possibly several times) to determine a termination sequence, inserts those characters and calls `overflow(trait::eof())` again. Finally, regardless of whether any of the preceding calls fails or throws an exception, the function closes the file (as if by calling `fclose(file)`). If any of the calls made by the function, including `fclose`, fails, `close` fails by returning a null pointer. If one of these calls throws an exception, the exception is caught and rethrown after closing the file.

*Postconditions:* `is_open() == false`.

*Returns:* `this` on success, a null pointer otherwise.

### 31.10.2.5 Overridden virtual functions

[filebuf.virtuals]

```
streamsize showmanyc() override;
```

*Effects:* Behaves the same as `basic_streambuf::showmanyc()` (31.6.3.5).

*Remarks:* An implementation may provide an overriding definition for this function signature if it can determine whether more characters can be read from the input sequence.

`int_type underflow()` override;

*Effects:* Behaves according to the description of `basic_streambuf<charT, traits>::underflow()`, with the specialization that a sequence of characters is read from the input sequence as if by reading from the associated file into an internal buffer (`extern_buf`) and then as if by doing:

```
char    extern_buf[XSIZE];
char*   extern_end;
charT   intern_buf[ISIZE];
charT*  intern_end;
codecvt_base::result r =
    a_codecvt.in(state, extern_buf, extern_buf+XSIZE, extern_end,
                intern_buf, intern_buf+ISIZE, intern_end);
```

This shall be done in such a way that the class can recover the position (`fpos_t`) corresponding to each character between `intern_buf` and `intern_end`. If the value of `r` indicates that `a_codecvt.in()` ran out of space in `intern_buf`, retry with a larger `intern_buf`.

`int_type uflow()` override;

*Effects:* Behaves according to the description of `basic_streambuf<charT, traits>::uflow()`, with the specialization that a sequence of characters is read from the input with the same method as used by `underflow`.

`int_type pbackfail(int_type c = traits::eof())` override;

*Effects:* Puts back the character designated by `c` to the input sequence, if possible, in one of three ways:

- If `traits::eq_int_type(c, traits::eof())` returns `false` and if the function makes a putback position available and if `traits::eq(to_char_type(c), gptr()[-1])` returns `true`, decrements the next pointer for the input sequence, `gptr()`.

Returns: `c`.

- If `traits::eq_int_type(c, traits::eof())` returns `false` and if the function makes a putback position available and if the function is permitted to assign to the putback position, decrements the next pointer for the input sequence, and stores `c` there.

Returns: `c`.

- If `traits::eq_int_type(c, traits::eof())` returns `true`, and if either the input sequence has a putback position available or the function makes a putback position available, decrements the next pointer for the input sequence, `gptr()`.

Returns: `traits::not_eof(c)`.

*Returns:* As specified above, or `traits::eof()` to indicate failure.

*Remarks:* If `is_open() == false`, the function always fails.

The function does not put back a character directly to the input sequence.

If the function can succeed in more than one of these ways, it is unspecified which way is chosen. The function can alter the number of putback positions available as a result of any call.

`int_type overflow(int_type c = traits::eof())` override;

*Effects:* Behaves according to the description of `basic_streambuf<charT, traits>::overflow(c)`, except that the behavior of “consuming characters” is performed by first converting as if by:

```
charT* b = pbase();
charT* p = pptr();
charT* end;
char    xbuf[XSIZE];
char*   xbuf_end;
codecvt_base::result r =
    a_codecvt.out(state, b, p, end, xbuf, xbuf+XSIZE, xbuf_end);
```

and then

- If `r == codecvt_base::error` then fail.
- If `r == codecvt_base::noconv` then output characters from `b` up to (and not including) `p`.

- If `r == codecvt_base::partial` then output to the file characters from `xbuf` up to `xbuf_end`, and repeat using characters from `end` to `p`. If output fails, fail (without repeating).
- Otherwise output from `xbuf` to `xbuf_end`, and fail if output fails. At this point if `b != p` and `b == end` (`xbuf` isn't large enough) then increase `XSIZE` and repeat from the beginning.

*Returns:* `traits::not_eof(c)` to indicate success, and `traits::eof()` to indicate failure. If `is_open() == false`, the function always fails.

`basic_streambuf* setbuf(char_type* s, streamsize n) override;`

*Effects:* If `setbuf(0, 0)` is called on a stream before any I/O has occurred on that stream, the stream becomes unbuffered. Otherwise the results are implementation-defined. “Unbuffered” means that `pbase()` and `pptr()` always return null and output to the file should appear as soon as possible.

`pos_type seekoff(off_type off, ios_base::seekdir way,  
ios_base::openmode which  
= ios_base::in | ios_base::out) override;`

*Effects:* Let `width` denote `a_codecvt.encoding()`. If `is_open() == false`, or `off != 0 && width <= 0`, then the positioning operation fails. Otherwise, if `way != basic_ios::cur` or `off != 0`, and if the last operation was output, then update the output sequence and write any unshift sequence. Next, seek to the new position: if `width > 0`, call `fseek(file, width * off, whence)`, otherwise call `fseek(file, 0, whence)`.

*Returns:* A newly constructed `pos_type` object that stores the resultant stream position, if possible. If the positioning operation fails, or if the object cannot represent the resultant stream position, returns `pos_type(off_type(-1))`.

*Remarks:* “The last operation was output” means either the last virtual operation was overflow or the put buffer is non-empty. “Write any unshift sequence” means, if `width` is less than zero then call `a_codecvt.unshift(state, xbuf, xbuf+XSIZE, xbuf_end)` and output the resulting unshift sequence. The function determines one of three values for the argument `whence`, of type `int`, as indicated in Table 129.

Table 129 — `seekoff` effects [tab:filebuf.seekoff]

| way                         | Value | stdio Equivalent      |
|-----------------------------|-------|-----------------------|
| <code>basic_ios::beg</code> |       | <code>SEEK_SET</code> |
| <code>basic_ios::cur</code> |       | <code>SEEK_CUR</code> |
| <code>basic_ios::end</code> |       | <code>SEEK_END</code> |

`pos_type seekpos(pos_type sp,  
ios_base::openmode which  
= ios_base::in | ios_base::out) override;`

Alters the file position, if possible, to correspond to the position stored in `sp` (as described below). Altering the file position performs as follows:

1. if `(om & ios_base::out) != 0`, then update the output sequence and write any unshift sequence;
2. set the file position to `sp` as if by a call to `fsetpos`;
3. if `(om & ios_base::in) != 0`, then update the input sequence;

where `om` is the open mode passed to the last call to `open()`. The operation fails if `is_open()` returns `false`.

If `sp` is an invalid stream position, or if the function positions neither sequence, the positioning operation fails. If `sp` has not been obtained by a previous successful call to one of the positioning functions (`seekoff` or `seekpos`) on the same file the effects are undefined.

*Returns:* `sp` on success. Otherwise returns `pos_type(off_type(-1))`.

`int sync() override;`

*Effects:* If a put area exists, calls `filebuf::overflow` to write the characters to the file, then flushes the file as if by calling `fflush(file)`. If a get area exists, the effect is implementation-defined.

```
void imbue(const locale& loc) override;
```

*Preconditions:* If the file is not positioned at its beginning and the encoding of the current locale as determined by `a_codecvt.encoding()` is state-dependent (30.4.2.5.3) then that facet is the same as the corresponding facet of `loc`.

*Effects:* Causes characters inserted or extracted after this call to be converted according to `loc` until another call of `imbue`.

*Remarks:* This may require reconversion of previously converted characters. This in turn may require the implementation to be able to reconstruct the original contents of the file.

### 31.10.3 Class template `basic_ifstream`

[ifstream]

#### 31.10.3.1 General

[ifstream.general]

```
namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_ifstream : public basic_istream<charT, traits> {
    public:
        using char_type    = charT;
        using int_type      = typename traits::int_type;
        using pos_type      = typename traits::pos_type;
        using off_type      = typename traits::off_type;
        using traits_type   = traits;

        // 31.10.3.2, constructors
        basic_ifstream();
        explicit basic_ifstream(const char* s,
                               ios_base::openmode mode = ios_base::in);
        explicit basic_ifstream(const filesystem::path::value_type* s,
                               ios_base::openmode mode = ios_base::in); // wide systems only; see 31.10.1
        explicit basic_ifstream(const string& s,
                               ios_base::openmode mode = ios_base::in);

        template<class T>
            explicit basic_ifstream(const T& s, ios_base::openmode mode = ios_base::in);
        basic_ifstream(const basic_ifstream&) = delete;
        basic_ifstream(basic_ifstream&& rhs);

        basic_ifstream& operator=(const basic_ifstream&) = delete;
        basic_ifstream& operator=(basic_ifstream&& rhs);

        // 31.10.3.3, swap
        void swap(basic_ifstream& rhs);

        // 31.10.3.4, members
        basic_filebuf<charT, traits>* rdbuf() const;

        bool is_open() const;
        void open(const char* s, ios_base::openmode mode = ios_base::in);
        void open(const filesystem::path::value_type* s,
                 ios_base::openmode mode = ios_base::in); // wide systems only; see 31.10.1
        void open(const string& s, ios_base::openmode mode = ios_base::in);
        void open(const filesystem::path& s, ios_base::openmode mode = ios_base::in);
        void close();

    private:
        basic_filebuf<charT, traits> sb; // exposition only
    };
}
```

The class `basic_ifstream<charT, traits>` supports reading from named files. It uses a `basic_filebuf<charT, traits>` object to control the associated sequence. For the sake of exposition, the maintained data is presented here as:

— `sb`, the filebuf object.

**31.10.3.2 Constructors****[ifstream.cons]**

```
basic_ifstream();
```

*Effects:* Initializes the base class with `basic_istream<charT, traits>(addressof(sb))` (31.7.5.2.2) and `sb` with `basic_filebuf<charT, traits>()` (31.10.2.2).

```
explicit basic_ifstream(const char* s,
                       ios_base::openmode mode = ios_base::in);
```

```
explicit basic_ifstream(const filesystem::path::value_type* s,
                       ios_base::openmode mode = ios_base::in); // wide systems only; see 31.10.1
```

*Effects:* Initializes the base class with `basic_istream<charT, traits>(addressof(sb))` (31.7.5.2.2) and `sb` with `basic_filebuf<charT, traits>()` (31.10.2.2), then calls `rdbuf()->open(s, mode | ios_base::in)`. If that function returns a null pointer, calls `setstate(failbit)`.

```
explicit basic_ifstream(const string& s,
                       ios_base::openmode mode = ios_base::in);
```

*Effects:* Equivalent to: `basic_ifstream(s.c_str(), mode)`.

```
template<class T>
```

```
explicit basic_ifstream(const T& s, ios_base::openmode mode = ios_base::in);
```

*Constraints:* `is_same_v<T, filesystem::path>` is true.

*Effects:* Equivalent to: `basic_ifstream(s.c_str(), mode)`.

```
basic_ifstream(basic_ifstream&& rhs);
```

*Effects:* Move constructs the base class, and the contained `basic_filebuf`. Then calls `basic_istream<charT, traits>::set_rdbuf(addressof(sb))` to install the contained `basic_filebuf`.

**31.10.3.3 Swap****[ifstream.swap]**

```
void swap(basic_ifstream& rhs);
```

*Effects:* Exchanges the state of `*this` and `rhs` by calling `basic_istream<charT, traits>::swap(rhs)` and `sb.swap(rhs.sb)`.

```
template<class charT, class traits>
```

```
void swap(basic_ifstream<charT, traits>& x, basic_ifstream<charT, traits>& y);
```

*Effects:* Equivalent to: `x.swap(y)`.

**31.10.3.4 Member functions****[ifstream.members]**

```
basic_filebuf<charT, traits>* rdbuf() const;
```

*Returns:* `const_cast<basic_filebuf<charT, traits>*>(addressof(sb))`.

```
bool is_open() const;
```

*Returns:* `rdbuf()->is_open()`.

```
void open(const char* s, ios_base::openmode mode = ios_base::in);
```

```
void open(const filesystem::path::value_type* s,
          ios_base::openmode mode = ios_base::in); // wide systems only; see 31.10.1
```

*Effects:* Calls `rdbuf()->open(s, mode | ios_base::in)`. If that function does not return a null pointer calls `clear()`, otherwise calls `setstate(failbit)` (which may throw `ios_base::failure`) (31.5.4.4).

```
void open(const string& s, ios_base::openmode mode = ios_base::in);
```

```
void open(const filesystem::path& s, ios_base::openmode mode = ios_base::in);
```

*Effects:* Calls `open(s.c_str(), mode)`.

```
void close();
```

*Effects:* Calls `rdbuf()->close()` and, if that function returns a null pointer, calls `setstate(failbit)` (which may throw `ios_base::failure`) (31.5.4.4).

**31.10.4 Class template basic\_ofstream****[ofstream]****31.10.4.1 General****[ofstream.general]**

```

namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_ofstream : public basic_ostream<charT, traits> {
    public:
        using char_type      = charT;
        using int_type        = typename traits::int_type;
        using pos_type        = typename traits::pos_type;
        using off_type        = typename traits::off_type;
        using traits_type     = traits;

        // 31.10.4.2, constructors
        basic_ofstream();
        explicit basic_ofstream(const char* s,
                               ios_base::openmode mode = ios_base::out);
        explicit basic_ofstream(const filesystem::path::value_type* s, // wide systems only; see 31.10.1
                               ios_base::openmode mode = ios_base::out);
        explicit basic_ofstream(const string& s,
                               ios_base::openmode mode = ios_base::out);

        template<class T>
            explicit basic_ofstream(const T& s, ios_base::openmode mode = ios_base::out);
        basic_ofstream(const basic_ofstream&) = delete;
        basic_ofstream(basic_ofstream&& rhs);

        basic_ofstream& operator=(const basic_ofstream&) = delete;
        basic_ofstream& operator=(basic_ofstream&& rhs);

        // 31.10.4.3, swap
        void swap(basic_ofstream& rhs);

        // 31.10.4.4, members
        basic_filebuf<charT, traits>* rdbuf() const;

        bool is_open() const;
        void open(const char* s, ios_base::openmode mode = ios_base::out);
        void open(const filesystem::path::value_type* s,
                 ios_base::openmode mode = ios_base::out); // wide systems only; see 31.10.1
        void open(const string& s, ios_base::openmode mode = ios_base::out);
        void open(const filesystem::path& s, ios_base::openmode mode = ios_base::out);
        void close();

    private:
        basic_filebuf<charT, traits> sb; // exposition only
    };
}

```

The class `basic_ofstream<charT, traits>` supports writing to named files. It uses a `basic_filebuf<charT, traits>` object to control the associated sequence. For the sake of exposition, the maintained data is presented here as:

— `sb`, the filebuf object.

**31.10.4.2 Constructors****[ofstream.cons]**

```
basic_ofstream();
```

*Effects:* Initializes the base class with `basic_ostream<charT, traits>(addressof(sb))` (31.7.6.2.2) and `sb` with `basic_filebuf<charT, traits>()` (31.10.2.2).

```
explicit basic_ofstream(const char* s,
                       ios_base::openmode mode = ios_base::out);
```

```
explicit basic_ofstream(const filesystem::path::value_type* s,
    ios_base::openmode mode = ios_base::out); // wide systems only; see 31.10.1
```

*Effects:* Initializes the base class with `basic_ostream<charT, traits>(addressof(sb))` (31.7.6.2.2) and `sb` with `basic_filebuf<charT, traits>()` (31.10.2.2), then calls `rdbuf()->open(s, mode | ios_base::out)`. If that function returns a null pointer, calls `setstate(failbit)`.

```
explicit basic_ofstream(const string& s,
    ios_base::openmode mode = ios_base::out);
```

*Effects:* Equivalent to: `basic_ofstream(s.c_str(), mode)`.

```
template<class T>
```

```
explicit basic_ofstream(const T& s, ios_base::openmode mode = ios_base::out);
```

*Constraints:* `is_same_v<T, filesystem::path>` is true.

*Effects:* Equivalent to: `basic_ofstream(s.c_str(), mode)`.

```
basic_ofstream(basic_ofstream&& rhs);
```

*Effects:* Move constructs the base class, and the contained `basic_filebuf`. Then calls `basic_ostream<charT, traits>::set_rdbuf(addressof(sb))` to install the contained `basic_filebuf`.

### 31.10.4.3 Swap

[ofstream.swap]

```
void swap(basic_ofstream& rhs);
```

*Effects:* Exchanges the state of `*this` and `rhs` by calling `basic_ostream<charT, traits>::swap(rhs)` and `sb.swap(rhs.sb)`.

```
template<class charT, class traits>
```

```
void swap(basic_ofstream<charT, traits>& x, basic_ofstream<charT, traits>& y);
```

*Effects:* Equivalent to: `x.swap(y)`.

### 31.10.4.4 Member functions

[ofstream.members]

```
basic_filebuf<charT, traits>* rdbuf() const;
```

*Returns:* `const_cast<basic_filebuf<charT, traits>*>(addressof(sb))`.

```
bool is_open() const;
```

*Returns:* `rdbuf()->is_open()`.

```
void open(const char* s, ios_base::openmode mode = ios_base::out);
```

```
void open(const filesystem::path::value_type* s,
    ios_base::openmode mode = ios_base::out); // wide systems only; see 31.10.1
```

*Effects:* Calls `rdbuf()->open(s, mode | ios_base::out)`. If that function does not return a null pointer calls `clear()`, otherwise calls `setstate(failbit)` (which may throw `ios_base::failure`) (31.5.4.4).

```
void close();
```

*Effects:* Calls `rdbuf()->close()` and, if that function fails (returns a null pointer), calls `setstate(failbit)` (which may throw `ios_base::failure`) (31.5.4.4).

```
void open(const string& s, ios_base::openmode mode = ios_base::out);
```

```
void open(const filesystem::path& s, ios_base::openmode mode = ios_base::out);
```

*Effects:* Calls `open(s.c_str(), mode)`.

## 31.10.5 Class template `basic_fstream`

[fstream]

### 31.10.5.1 General

[fstream.general]

```
namespace std {
```

```
template<class charT, class traits = char_traits<charT>>
```

```
class basic_fstream : public basic_iostream<charT, traits> {
```

```
public:
```

```
using char_type = charT;
```

```

using int_type      = typename traits::int_type;
using pos_type      = typename traits::pos_type;
using off_type      = typename traits::off_type;
using traits_type    = traits;

// 31.10.5.2, constructors
basic_fstream();
explicit basic_fstream(
    const char* s,
    ios_base::openmode mode = ios_base::in | ios_base::out);
explicit basic_fstream(
    const filesystem::path::value_type* s,
    ios_base::openmode mode = ios_base::in|ios_base::out);    // wide systems only; see 31.10.1
explicit basic_fstream(
    const string& s,
    ios_base::openmode mode = ios_base::in | ios_base::out);
template<class T>
    explicit basic_fstream(const T& s, ios_base::openmode mode = ios_base::in | ios_base::out);
basic_fstream(const basic_fstream&) = delete;
basic_fstream(basic_fstream&& rhs);

basic_fstream& operator=(const basic_fstream&) = delete;
basic_fstream& operator=(basic_fstream&& rhs);

// 31.10.5.3, swap
void swap(basic_fstream& rhs);

// 31.10.5.4, members
basic_filebuf<charT, traits>* rdbuf() const;
bool is_open() const;
void open(
    const char* s,
    ios_base::openmode mode = ios_base::in | ios_base::out);
void open(
    const filesystem::path::value_type* s,
    ios_base::openmode mode = ios_base::in|ios_base::out);    // wide systems only; see 31.10.1
void open(
    const string& s,
    ios_base::openmode mode = ios_base::in | ios_base::out);
void open(
    const filesystem::path& s,
    ios_base::openmode mode = ios_base::in | ios_base::out);
void close();

private:
    basic_filebuf<charT, traits> sb;    // exposition only
};
}

```

The class template `basic_fstream<charT, traits>` supports reading and writing from named files. It uses a `basic_filebuf<charT, traits>` object to control the associated sequences. For the sake of exposition, the maintained data is presented here as:

— `sb`, the `basic_filebuf` object.

### 31.10.5.2 Constructors

[fstream.cons]

```
basic_fstream();
```

*Effects:* Initializes the base class with `basic_iostream<charT, traits>(addressof(sb))` (31.7.5.7.2) and `sb` with `basic_filebuf<charT, traits>()`.

```
explicit basic_fstream(
    const char* s,
    ios_base::openmode mode = ios_base::in | ios_base::out);
```

```
explicit basic_fstream(
    const filesystem::path::value_type* s,
    ios_base::openmode mode = ios_base::in | ios_base::out); // wide systems only; see 31.10.1
```

*Effects:* Initializes the base class with `basic_iostream<charT, traits>(addressof(sb))` (31.7.5.7.2) and `sb` with `basic_filebuf<charT, traits>()`. Then calls `rddbuf()->open(s, mode)`. If that function returns a null pointer, calls `setstate(failbit)`.

```
explicit basic_fstream(
    const string& s,
    ios_base::openmode mode = ios_base::in | ios_base::out);
```

*Effects:* Equivalent to: `basic_fstream(s.c_str(), mode)`.

```
template<class T>
explicit basic_fstream(const T& s, ios_base::openmode mode = ios_base::in | ios_base::out);
```

*Constraints:* `is_same_v<T, filesystem::path>` is true.

*Effects:* Equivalent to: `basic_fstream(s.c_str(), mode)`.

```
basic_fstream(basic_fstream&& rhs);
```

*Effects:* Move constructs the base class, and the contained `basic_filebuf`. Then calls `basic_iostream<charT, traits>::set_rdbuf(addressof(sb))` to install the contained `basic_filebuf`.

### 31.10.5.3 Swap [fstream.swap]

```
void swap(basic_fstream& rhs);
```

*Effects:* Exchanges the state of `*this` and `rhs` by calling `basic_iostream<charT, traits>::swap(rhs)` and `sb.swap(rhs.sb)`.

```
template<class charT, class traits>
void swap(basic_fstream<charT, traits>& x,
          basic_fstream<charT, traits>& y);
```

*Effects:* Equivalent to: `x.swap(y)`.

### 31.10.5.4 Member functions [fstream.members]

```
basic_filebuf<charT, traits>* rdbuf() const;
```

*Returns:* `const_cast<basic_filebuf<charT, traits>*>(addressof(sb))`.

```
bool is_open() const;
```

*Returns:* `rddbuf()->is_open()`.

```
void open(
    const char* s,
    ios_base::openmode mode = ios_base::in | ios_base::out);
void open(
    const filesystem::path::value_type* s,
    ios_base::openmode mode = ios_base::in | ios_base::out); // wide systems only; see 31.10.1
```

*Effects:* Calls `rddbuf()->open(s, mode)`. If that function does not return a null pointer calls `clear()`, otherwise calls `setstate(failbit)` (which may throw `ios_base::failure`) (31.5.4.4).

```
void open(
    const string& s,
    ios_base::openmode mode = ios_base::in | ios_base::out);
void open(
    const filesystem::path& s,
    ios_base::openmode mode = ios_base::in | ios_base::out);
```

*Effects:* Calls `open(s.c_str(), mode)`.

```
void close();
```

*Effects:* Calls `rddbuf()->close()` and, if that function returns a null pointer, calls `setstate(failbit)` (which may throw `ios_base::failure`) (31.5.4.4).

**31.11 Synchronized output streams**

[syncstream]

**31.11.1 Header <syncstream> synopsis**

[syncstream.syn]

```
#include <ostream> // see 31.7.2

namespace std {
    template<class charT, class traits = char_traits<charT>, class Allocator = allocator<charT>>
        class basic_syncbuf;

    // 31.11.2.6, specialized algorithms
    template<class charT, class traits, class Allocator>
        void swap(basic_syncbuf<charT, traits, Allocator>&,
                  basic_syncbuf<charT, traits, Allocator>&);

    using syncbuf = basic_syncbuf<char>;
    using wsyncbuf = basic_syncbuf<wchar_t>;

    template<class charT, class traits = char_traits<charT>, class Allocator = allocator<charT>>
        class basic_ostream;

    using ostream = basic_ostream<char>;
    using wostream = basic_ostream<wchar_t>;
}
```

The header <syncstream> provides a mechanism to synchronize execution agents writing to the same stream.

**31.11.2 Class template basic\_syncbuf**

[syncstream.syncbuf]

**31.11.2.1 Overview**

[syncstream.syncbuf.overview]

```
namespace std {
    template<class charT, class traits = char_traits<charT>, class Allocator = allocator<charT>>
        class basic_syncbuf : public basic_streambuf<charT, traits> {
        public:
            using char_type      = charT;
            using int_type       = typename traits::int_type;
            using pos_type       = typename traits::pos_type;
            using off_type       = typename traits::off_type;
            using traits_type     = traits;
            using allocator_type = Allocator;

            using streambuf_type = basic_streambuf<charT, traits>;

            // 31.11.2.2, construction and destruction
            basic_syncbuf()
                : basic_syncbuf(nullptr) {}
            explicit basic_syncbuf(streambuf_type* obuf)
                : basic_syncbuf(obuf, Allocator()) {}
            basic_syncbuf(streambuf_type*, const Allocator&);
            basic_syncbuf(basic_syncbuf&&);
            ~basic_syncbuf();

            // 31.11.2.3, assignment and swap
            basic_syncbuf& operator=(basic_syncbuf&&);
            void swap(basic_syncbuf&);

            // 31.11.2.4, member functions
            bool emit();
            streambuf_type* get_wrapped() const noexcept;
            allocator_type get_allocator() const noexcept;
            void set_emit_on_sync(bool) noexcept;

        protected:
            // 31.11.2.5, overridden virtual functions
            int sync() override;

```

```

private:
    streambuf_type* wrapped;    // exposition only
    bool emit_on_sync{};        // exposition only
};
}

```

Class template `basic_syncbuf` stores character data written to it, known as the associated output, into internal buffers allocated using the object's allocator. The associated output is transferred to the wrapped stream buffer object `*wrapped` when `emit()` is called or when the `basic_syncbuf` object is destroyed. Such transfers are atomic with respect to transfers by other `basic_syncbuf` objects with the same wrapped stream buffer object.

### 31.11.2.2 Construction and destruction

[syncstream.syncbuf.cons]

```
basic_syncbuf(streambuf_type* obuf, const Allocator& allocator);
```

*Effects:* Sets `wrapped` to `obuf`.

*Postconditions:* `get_wrapped() == obuf` and `get_allocator() == allocator` are true.

*Throws:* Nothing unless an exception is thrown by the construction of a mutex or by memory allocation.

*Remarks:* A copy of `allocator` is used to allocate memory for internal buffers holding the associated output.

```
basic_syncbuf(basic_syncbuf&& other);
```

*Postconditions:* The value returned by `this->get_wrapped()` is the value returned by `other.get_wrapped()` prior to calling this constructor. Output stored in `other` prior to calling this constructor will be stored in `*this` afterwards. `other.pbase() == other.pptr()` and `other.get_wrapped() == nullptr` are true.

*Remarks:* This constructor disassociates `other` from its wrapped stream buffer, ensuring destruction of `other` produces no output.

```
~basic_syncbuf();
```

*Effects:* Calls `emit()`.

*Throws:* Nothing. If an exception is thrown from `emit()`, the destructor catches and ignores that exception.

### 31.11.2.3 Assignment and swap

[syncstream.syncbuf.assign]

```
basic_syncbuf& operator=(basic_syncbuf&& rhs);
```

*Effects:* Calls `emit()` then move assigns from `rhs`. After the move assignment `*this` has the observable state it would have had if it had been move constructed from `rhs` (31.11.2.2).

*Postconditions:*

- `rhs.get_wrapped() == nullptr` is true.
- `this->get_allocator() == rhs.get_allocator()` is true when `allocator_traits<Allocator>::propagate_on_container_move_assignment::value` is true; otherwise, the allocator is unchanged.

*Returns:* `*this`.

*Remarks:* This assignment operator disassociates `rhs` from its wrapped stream buffer, ensuring destruction of `rhs` produces no output.

```
void swap(basic_syncbuf& other);
```

*Preconditions:* Either `allocator_traits<Allocator>::propagate_on_container_swap::value` is true or `this->get_allocator() == other.get_allocator()` is true.

*Effects:* Exchanges the state of `*this` and `other`.

**31.11.2.4 Member functions**

[syncstream.syncbuf.members]

```
bool emit();
```

*Effects:* Atomically transfers the associated output of **\*this** to the stream buffer **\*wrapped**, so that it appears in the output stream as a contiguous sequence of characters. **wrapped->pubsync()** is called if and only if a call was made to **sync()** since the most recent call to **emit()**, if any.

*Synchronization:* All **emit()** calls transferring characters to the same stream buffer object appear to execute in a total order consistent with the “happens before” relation (6.9.2.2), where each **emit()** call synchronizes with subsequent **emit()** calls in that total order.

*Postconditions:* On success, the associated output is empty.

*Returns:* **true** if all of the following conditions hold; otherwise **false**:

- **wrapped == nullptr** is **false**.
- All of the characters in the associated output were successfully transferred.
- The call to **wrapped->pubsync()** (if any) succeeded.

*Remarks:* May call member functions of **wrapped** while holding a lock uniquely associated with **wrapped**.

```
streambuf_type* get_wrapped() const noexcept;
```

*Returns:* **wrapped**.

```
allocator_type get_allocator() const noexcept;
```

*Returns:* A copy of the allocator that was set in the constructor or assignment operator.

```
void set_emit_on_sync(bool b) noexcept;
```

*Effects:* **emit\_on\_sync = b**.

**31.11.2.5 Overridden virtual functions**

[syncstream.syncbuf.virtuals]

```
int sync() override;
```

*Effects:* Records that the wrapped stream buffer is to be flushed. Then, if **emit\_on\_sync** is **true**, calls **emit()**.

NOTE If **emit\_on\_sync** is **false**, the actual flush is delayed until a call to **emit()**.

*Returns:* If **emit()** was called and returned **false**, returns **-1**; otherwise **0**.

**31.11.2.6 Specialized algorithms**

[syncstream.syncbuf.special]

```
template<class charT, class traits, class Allocator>
void swap(basic_syncbuf<charT, traits, Allocator>& a,
         basic_syncbuf<charT, traits, Allocator>& b);
```

*Effects:* Equivalent to **a.swap(b)**.

**31.11.3 Class template basic\_osyncstream**

[syncstream.osyncstream]

**31.11.3.1 Overview**

[syncstream.osyncstream.overview]

```
namespace std {
    template<class charT, class traits = char_traits<charT>, class Allocator = allocator<charT>>
    class basic_osyncstream : public basic_ostream<charT, traits> {
    public:
        using char_type      = charT;
        using int_type        = typename traits::int_type;
        using pos_type        = typename traits::pos_type;
        using off_type        = typename traits::off_type;
        using traits_type     = traits;

        using allocator_type  = Allocator;
        using streambuf_type  = basic_streambuf<charT, traits>;
        using syncbuf_type    = basic_syncbuf<charT, traits, Allocator>;
```

```

// 31.11.3.2, construction and destruction
basic_osyncstream(streambuf_type*, const Allocator&);
explicit basic_osyncstream(streambuf_type* obuf)
    : basic_osyncstream(obuf, Allocator()) {}
basic_osyncstream(basic_ostream<charT, traits>& os, const Allocator& allocator)
    : basic_osyncstream(os.rdbuf(), allocator) {}
explicit basic_osyncstream(basic_ostream<charT, traits>& os)
    : basic_osyncstream(os, Allocator()) {}
basic_osyncstream(basic_osyncstream&&) noexcept;
~basic_osyncstream();

// assignment
basic_osyncstream& operator=(basic_osyncstream&&);

// 31.11.3.3, member functions
void emit();
streambuf_type* get_wrapped() const noexcept;
syncbuf_type* rdbuf() const noexcept { return const_cast<syncbuf_type*>(addressof(sb)); }

private:
    syncbuf_type sb;    // exposition only
};
}

```

Allocator shall meet the *Cpp17Allocator* requirements (16.4.4.6.1).

EXAMPLE 1 A named variable can be used within a block statement for streaming.

```

{
    ostream bout(cout);
    bout << "Hello, ";
    bout << "World!";
    bout << endl; // flush is noted
    bout << "and more!\n";
} // characters are transferred and cout is flushed

```

EXAMPLE 2 A temporary object can be used for streaming within a single statement.

```
ostream(cout) << "Hello, " << "World!" << '\n';
```

In this example, cout is not flushed.

### 31.11.3.2 Construction and destruction

[syncstream.osyncstream.cons]

```
basic_osyncstream(streambuf_type* buf, const Allocator& allocator);
```

*Effects:* Initializes sb from buf and allocator. Initializes the base class with basic\_ostream<charT, traits>(addressof(sb)).

NOTE The member functions of the provided stream buffer can be called from emit() while a lock is held, which can result in a deadlock if used incautiously.

*Postconditions:* get\_wrapped() == buf is true.

```
basic_osyncstream(basic_osyncstream&& other) noexcept;
```

*Effects:* Move constructs the base class and sb from the corresponding subobjects of other, and calls basic\_ostream<charT, traits>::set\_rdbuf(addressof(sb)).

*Postconditions:* The value returned by get\_wrapped() is the value returned by other.get\_wrapped() prior to calling this constructor. nullptr == other.get\_wrapped() is true.

### 31.11.3.3 Member functions

[syncstream.osyncstream.members]

```
void emit();
```

*Effects:* Behaves as an unformatted output function (31.7.6.4). After constructing a sentry object, calls sb.emit(). If that call returns false, calls setstate(ios\_base::badbit).

EXAMPLE 1 A flush on a basic\_osyncstream does not flush immediately:

```

{
    ostream bout(cout);

```
